

### FEATURES

**High accuracy over line and load:  $\pm 0.8\%$  @  $25^\circ\text{C}$ ,  
 $\pm 1.4\%$  over temperature**  
**Ultralow dropout voltage: 190 mV (typ) @ 1 A**  
**Requires only  $C_O = 1.0 \mu\text{F}$  for stability**  
**anyCAP is stable with any type of capacitor (including MLCC)**  
**Current and thermal limiting**  
**Low noise**  
**2.7 V to 8 V supply range**  
 **$-40^\circ\text{C}$  to  $+85^\circ\text{C}$  ambient temperature range**  
**SOT-223 package**

### APPLICATIONS

Notebook, palmtop computers  
 SCSI terminators  
 Battery-powered systems  
 Bar code scanners  
 Camcorders, cameras  
 Home entertainment systems  
 Networking systems  
 DSP/ASIC supplies

### GENERAL DESCRIPTION

The ADP3338 is a member of the ADP33xx family of precision, low dropout (LDO), anyCAP voltage regulators. The ADP3338 operates with an input voltage range of 2.7 V to 8 V and delivers a load current up to 1 A. The ADP3338 stands out from conventional LDOs with a novel architecture and an enhanced process that offers performance advantages and higher output current than its competition. Its patented design requires only a  $1 \mu\text{F}$  output capacitor for stability. This device is insensitive to output capacitor equivalent series resistance (ESR), and is stable

Figure 1.

Figure 2. Typical Application Circuit

with any good quality capacitor, including ceramic (MLCC) types for space-restricted applications. The ADP3338 achieves exceptional accuracy of  $\pm 0.8\%$  at room temperature and  $\pm 1.4\%$  over temperature, line, and load variations. The dropout voltage of the ADP3338 is only 190 mV (typical) at 1 A. The device also includes a safety current limit and thermal overload protection. The ADP3338 has ultralow quiescent current: 110  $\mu\text{A}$  (typical) in light load situations.

## MEMS motion sensor: three-axis digital output accelerometer

Datasheet - production data

### Features

- 3-axis,  $\pm 2.5 g$  full-scale
- Ultra-low noise performance:  $45 \mu g/\sqrt{Hz}$
- Excellent stability over temperature ( $< 0.4 mg/^\circ C$ ) and time
- 16-bit data output
- SPI 4-wire digital output interface
- Embedded temperature sensor
- 12-bit temperature data output
- Embedded FIFO (depth 32 levels)
- High shock survivability
- Extended operating temperature range ( $-40^\circ C$  to  $+85^\circ C$ )
- ECOPACK<sup>®</sup>, RoHS and “Green” compliant

### Applications

- Precision inclinometer
- Platform and antenna stabilization
- Leveling instruments

### Description

The LIS3DHH is an ultra-high-resolution and low-noise three-axis linear accelerometer.

The LIS3DHH has a full scale of  $\pm 2.5 g$  and is capable of providing the measured accelerations to the application through an SPI 4-wire digital interface.

The sensing element is manufactured using a dedicated micromachining process developed by STMicroelectronics to produce inertial sensors and actuators on silicon wafers.

The IC interface is manufactured using a CMOS process that allows a high level of integration to design a dedicated circuit which is trimmed to better match the characteristics of the sensing element.

The LIS3DHH is available in a high-performance (low-stress) ceramic cavity land grid array (CC LGA) package and can operate within a temperature range of  $-40^\circ C$  to  $+85^\circ C$ .

**Table 1. Device summary**

Order codes	Temperature range [ $^\circ C$ ]	Package	Packaging
LIS3DHHTR	$-40$ to $+85$	CC LGA-16 (5x5x1.7 mm)	Tape and reel

## 2 Mechanical and electrical specifications

### 2.1 Mechanical characteristics

@ Vdd = 2.8 V, T = 25 °C unless otherwise noted.

**Table 3. Mechanical characteristics**

Symbol	Parameter	Test condition	Min.	Typ. <sup>(1)</sup>	Max.	Unit
FS	Measurement range <sup>(2)</sup>			±2.5		g
So	Sensitivity <sup>(3)</sup>			0.076		mg/digit
TCSO	Sensitivity change vs. temperature	From -40 °C to +85 °C, delta from 25°C		0.7		%
Off	Zero-g level offset accuracy <sup>(4)</sup>			±20		mg
TCOff	Zero-g level change vs. temperature <sup>(5)</sup>	From -40 °C to +85 °C, delta from 25 °C	-0.4		0.4	mg/°C
NL	Non linearity	Best-fit straight line			2	% FS
Zgn	Zero-g noise density	FS = ±2.5 g		45	65	ug/(√Hz)
ODR	Digital output data rate			1.1		kHz
Bw	Bandwidth	For both FIR and IIR filters		235 or 440		Hz
StartT	Startup time	For cold start condition			150	ms
ST	Self-test positive difference <sup>(6)</sup>	X, Y-axis Z-axis	75 75		650 1400	mg
Top	Operating temperature range		-40		+85	°C

1. Typical specifications are not guaranteed.
2. Sensor is designed with larger dynamic to avoid variation of FS limits in the operative bandwidth. Consequently to trim operations at factory final test.
3. Sensitivity range after MSL3 preconditioning.
4. Typical zero-g level offset value after MSL3 preconditioning.
5. Min/max at 3 sigma. Based on characterization data for a limited number of samples, not measured during final test for production.
6. Self-test positive difference is defined as:  

$$\text{OUTPUT}[\text{mg}](\text{CTRL\_REG4 (23h)}_{\text{ST2, ST1 bits} = 01}) - \text{OUTPUT}[\text{mg}](\text{CTRL\_REG4 (23h)}_{\text{ST2, ST1 bits} = 00})$$
 in steady state.

## 2.2 Electrical characteristics

@ Vdd = 2.8 V, T = 25 °C unless otherwise noted.

**Table 4. Electrical characteristics**

Symbol	Parameter	Test condition	Min.	Typ. <sup>(1)</sup>	Max.	Unit
Vdd	Supply voltage		1.71	2.8	3.6	V
Vdd_IO	I/O pins supply voltage		1.71		Vdd+0.1	V
Idd	Supply current			2.5	5	mA
V <sub>IH</sub>	Digital high-level input voltage		0.7*Vdd_IO			V
V <sub>IL</sub>	Digital low-level input voltage				0.3*Vdd_IO	V
V <sub>OH</sub>	High-level output voltage	I <sub>OH</sub> = 4 mA <sup>(2)</sup>	Vdd_IO - 0.2			V
V <sub>OL</sub>	Low-level output voltage	I <sub>OL</sub> = 4 mA <sup>(2)</sup>			0.2	V
Top	Operating temperature range		-40		+85	°C
SPI_Fr	SPI frequency	4-wire interface		5	10	MHz
Trise	Time for power supply rising <sup>(3)</sup>		0.01		100	ms
Twait	Time delay between Vdd_IO and Vdd <sup>(3)</sup>		0		10	ms

1. Typical specifications are not guaranteed.
2. 4 mA is the maximum driving capability, i.e. the maximum DC current that can be sourced/sunk by the digital pad in order to guarantee the correct digital output voltage levels V<sub>OH</sub> and V<sub>OL</sub>.
3. Please refer to [Section 2.2.1: Recommended power-up sequence](#) for more details.

### 2.2.1 Recommended power-up sequence

For the power-up sequence please refer to the following figure, where:

- Trise is the time for the power supply to rise from 10% to 90% of its final value
- Twait is the time delay between the end of the Vdd\_IO ramp (90% of its final value) and the start of the Vdd ramp

In the power-down sequence Vdd and Vdd\_IO can come down in any order.

Figure 2. Recommended power-up sequence

### 2.3 Temperature sensor characteristics

@ Vdd = 2.8 V, T = 25 °C unless otherwise noted.

Table 5. Temperature sensor characteristics

Symbol	Parameter	Test condition	Min.	Typ. <sup>(1)</sup>	Max.	Unit
TSDr	Temperature sensor output change vs. temperature			16		digit/°C
Tn	Temperature sensor noise (RMS)				0.1	°C
Ta	Temperature accuracy		-15		+15	°C
TODR	Temperature refresh rate	equal to ODR/16	62.5			Hz
TNL	Temperature nonlinearity	Best-fit straight line		5		% Top
Top	Operating temperature range		-40		+85	°C

1. Typical specifications are not guaranteed.

### 3 Absolute maximum ratings

Stresses above those listed as “Absolute maximum ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device under these conditions is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

**Table 6. Absolute maximum ratings**

Symbol	Ratings	Maximum value	Unit
Vdd and Vdd_IO	Supply voltage	-0.3 to 4.8	V
T <sub>STG</sub>	Storage temperature range	-40 to +85	°C
Sg	Acceleration g for 0.2 ms	10,000	g
ESD	Electrostatic discharge protection (HBM)	2	kV
V <sub>in</sub>	Input voltage on any control pin (including CS, SPC, SDI, SDO)	-0.3 to Vdd_IO +0.3	V

*Note:* Supply voltage on any pin should never exceed 4.8 V.

This device is sensitive to mechanical shock, improper handling can cause permanent damage to the part.

This device is sensitive to electrostatic discharge (ESD), improper handling can cause permanent damage to the part.

## 4 Communication interface characteristics

### 4.1 SPI - serial peripheral interface

Subject to general operating conditions for Vdd and Top.

Table 7. SPI slave timing values

Symbol	Parameter	Value <sup>(1)</sup>		Unit
		Min	Max	
$t_{c(SPC)}$	SPI clock cycle	100		ns
$f_{c(SPC)}$	SPI clock frequency		10	MHz
$t_{su(CS)}$	CS setup time	5		ns
$t_{h(CS)}$	CS hold time	20		
$t_{su(SI)}$	SDI input setup time	5		
$t_{h(SI)}$	SDI input hold time	15		
$t_{v(SO)}$	SDO valid output time		50	
$t_{h(SO)}$	SDO output hold time	5		
$t_{dis(SO)}$	SDO output disable time		50	

1. Values are guaranteed at 10 MHz clock frequency for SPI 4 wires, based on characterization results, not tested in production

Figure 3. SPI slave timing diagram

Note: Measurement points are done at  $0.2 \cdot V_{dd\_IO}$  and  $0.8 \cdot V_{dd\_IO}$ , for both input and output ports.

Note: The SPI state machine is reset each time the CS signal is de-asserted.

## 4.2 SPI bus interface

The LIS3DHH SPI is a bus slave. The SPI allows writing and reading the registers of the device.

The serial interface interacts with the application using 4 wires: **CS**, **SPC**, **SDI** and **SDO**.

Figure 4. Read and write protocol

**CS** is the serial port enable and it is controlled by the SPI master. It goes low at the start of the transmission and goes back high at the end. **SPC** is the serial port clock and it is controlled by the SPI master. It is stopped high when **CS** is high (no transmission). **SDI** and **SDO** are respectively the serial port data input and output. These lines are driven at the falling edge of **SPC** and should be captured at the rising edge of **SPC**.

Both the read register and write register commands are completed in 16 clock pulses or in multiples of 8 in case of multiple read/write bytes. Bit duration is the time between two falling edges of **SPC**. The first bit (bit 0) starts at the first falling edge of **SPC** after the falling edge of **CS** while the last bit (bit 15, bit 23, ...) starts at the last falling edge of **SPC** just before the rising edge of **CS**.

**bit 0:**  $\overline{RW}$  bit. When 0, the data DI(7:0) is written into the device. When 1, the data DO(7:0) from the device is read. In latter case, the chip will drive **SDO** at the start of bit 8.

**bit 1-7:** address AD(6:0). This is the address field of the indexed register.

**bit 8-15:** data DI(7:0) (write mode). This is the data that is written into the device (MSb first).

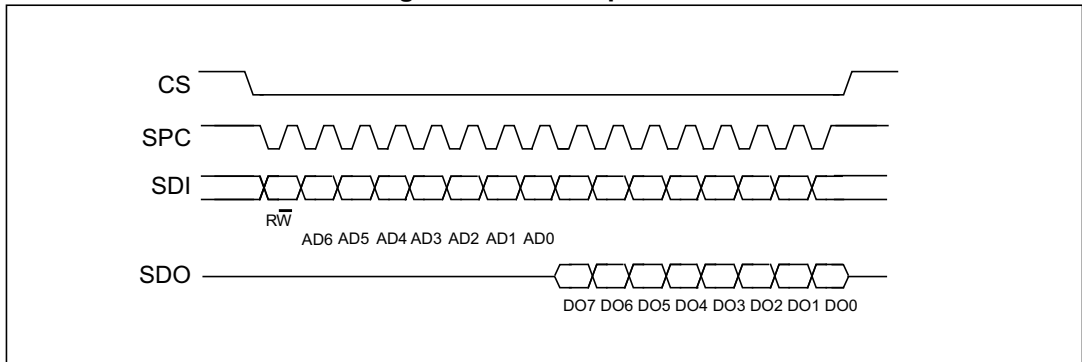

**bit 8-15:** data DO(7:0) (read mode). This is the data that is read from the device (MSb first).

In multiple read/write commands further blocks of 8 clock periods will be added. When the **CTRL\_REG1 (20h)** (IF\_ADD\_INC) bit is '0' the address used to read/write data remains the same for every block. When **CTRL\_REG1 (20h)**(IF\_ADD\_INC) bit is '1' the address used to read/write data is increased at every block.

The function and the behavior of **SDI** and **SDO** remain unchanged.

4.2.1 SPI read

Figure 5. SPI read protocol

The SPI read command is performed with 16 clock pulses. The multiple byte read command is performed by adding blocks of 8 clock pulses to the previous one.

**bit 0:** READ bit. The value is 1.

**bit 1-7:** address AD(6:0). This is the address field of the indexed register.

**bit 8-15:** data DO(7:0) (read mode). This is the data that will be read from the device (MSb first).

**bit 16-...** : data DO(...-8). Further data in multiple byte reads.

Figure 6. Multiple byte SPI read protocol (2-byte example)

### 4.2.2 SPI write

Figure 7. SPI write protocol

The SPI write command is performed with 16 clock pulses. The multiple byte write command is performed by adding blocks of 8 clock pulses to the previous one.

**bit 0:** WRITE bit. The value is 0.

**bit 1 -7:** address AD(6:0). This is the address field of the indexed register.

**bit 8-15:** data DI(7:0) (write mode). This is the data that is written inside the device (MSb first).

**bit 16-...** : data DI(...-8). Further data in multiple byte writes.

Figure 8. Multiple byte SPI write protocol (2-byte example)

## 5 FIFO

The LIS3DHH embeds 32 slots of 16-bit data FIFO for each of the accelerometer's three output channels, X, Y and Z. This allows consistent power saving for the system since the host processor does not need to continuously poll data from the sensor, but it can wake up only when needed and burst the significant data out from the FIFO. This buffer can work accordingly to five different modes: Bypass mode, FIFO mode, Continuous mode, Continuous-to-FIFO mode and Bypass-to-Continuous mode. Each mode is selected by the FMODE [2:0] bits in the *FIFO\_CTRL (2Eh)* register. Programmable FIFO threshold status, FIFO overrun events and the number of unread samples stored are available in the *FIFO\_SRC (2Fh)* register and can be set to generate dedicated interrupts on the INT1 and INT2 pins using the *INT1\_CTRL (21h)* and *INT2\_CTRL (22h)* registers.

*FIFO\_SRC (2Fh)*(FTH) goes to '1' when the number of unread samples (*FIFO\_SRC (2Fh)* (FSS5:0)) is greater than or equal to FTH [4:0] in *FIFO\_CTRL (2Eh)*. If *FIFO\_CTRL (2Eh)* (FTH[4:0]) is equal to 0, *FIFO\_SRC (2Fh)*(FTH) goes to '0'.

*FIFO\_SRC (2Fh)*(OVRN) is equal to '1' if a FIFO slot is overwritten.

*FIFO\_SRC (2Fh)*(FSS [5:0]) contains stored data levels of unread samples. When FSS [5:0] is equal to '000000', FIFO is empty. When FSS [5:0] is equal to '100000', FIFO is full and the unread samples are 32.

The FIFO feature is enabled by writing '1' in *CTRL\_REG4 (23h)* (FIFO\_EN).

To guarantee the correct acquisition of data during the switching into and out of FIFO mode, the first sample acquired must be discarded.

### 5.1 Bypass mode

In Bypass mode (*FIFO\_CTRL (2Eh)*(FMODE [2:0]= 000), the FIFO is not operational, no data is collected in FIFO memory, and it remains empty with the only actual sample available in the output registers.

Bypass mode is also used to reset the FIFO when in FIFO mode.

As described in *Figure 9*, for each channel only the first address is used. When new data is available the old data is overwritten.

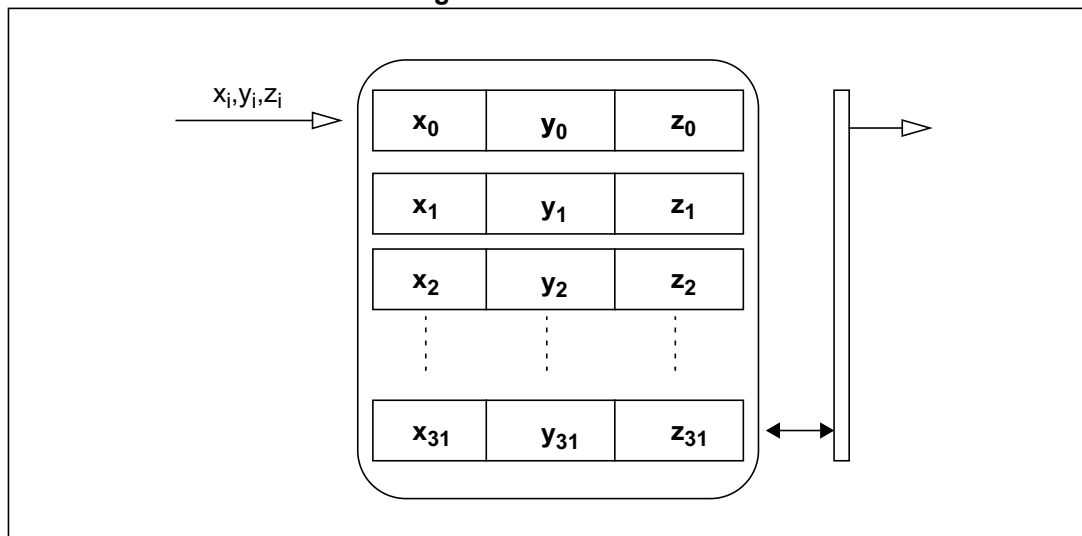

## 5.2 FIFO mode

In FIFO mode (*FIFO\_CTRL (2Eh)* (FMODE [2:0] = 001) data from the output channels are stored in the FIFO memory until it is full, when 32 unread samples are stored in memory, data collecting is stopped.

To reset FIFO content, Bypass mode should be selected by writing *FIFO\_CTRL (2Eh)* (FMODE [2:0]) to '000'. After this reset command, it is possible to restart FIFO mode, writing *FIFO\_CTRL (2Eh)* (FMODE [2:0]) to '001'.

A FIFO threshold interrupt can be enabled (INT1\_OVR bit in *INT1\_CTRL (21h)* or INT2\_OVR bit in *INT2\_CTRL (22h)*) in order to be raised when the FIFO is filled to the level specified by the FTH[4:0] bits of *FIFO\_CTRL (2Eh)*.

Figure 10. FIFO mode

### 5.3 Continuous mode

Continuous mode (*FIFO\_CTRL (2Eh)* (FMODE[2:0] = 110) provides a continuous FIFO update: when 32 unread samples are stored in memory, as new data arrives the oldest data is discarded and overwritten by the newer.

A FIFO threshold flag *FIFO\_SRC (2Fh)*(FTH) is asserted when the number of unread samples in FIFO is greater than or equal to *FIFO\_CTRL (2Eh)*(FTH4:0).

It is possible to route *FIFO\_SRC (2Fh)*(FTH) to the INT1 pin by writing the INT1\_FTH bit to '1' in register *INT1\_CTRL (21h)* or to the INT2 pin by writing the INT2\_FTH bit to '1' in register *INT2\_CTRL (22h)*.

A full-flag interrupt can be enabled (*INT1\_CTRL (21h)* (INT\_FSS5)= '1' or *INT2\_CTRL (22h)* (INT\_FSS5)= '1') when the FIFO becomes saturated and in order to read the contents all at once. If an overrun occurs, the oldest sample in FIFO is overwritten and the OVRN flag in *FIFO\_SRC (2Fh)* is asserted.

In order to empty the FIFO before it is full, it is also possible to pull from FIFO the number of unread samples available in *FIFO\_SRC (2Fh)* (FSS[5:0]).

**Figure 11. Continuous mode**

### 5.4 Continuous-to-FIFO mode

In Continuous-to-FIFO mode (*FIFO\_CTRL (2Eh)*(FMODE [2:0] = 011), FIFO operates in Continuous mode and FIFO mode starts on the INT1 edge trigger event. When the FIFO is full, data collecting is stopped.

Figure 12. Continuous-to-FIFO mode

Figure 13. External asynchronous trigger to FIFO for Continuous-to-FIFO mode

### 5.5 Bypass-to-Continuous mode

In Bypass-to-Continuous mode (*FIFO\_CTRL (2Eh)*(FMODE[2:0] = '100'), data measurement storage inside FIFO starts in Continuous mode on the INT1 edge trigger event, then the sample that follows the trigger is available in FIFO.

Figure 14. Bypass-to-Continuous mode

Figure 15. External asynchronous trigger to FIFO for Bypass-to-Continuous mode

## 6 Register mapping

The table given below provides a list of the 8/16-bit registers embedded in the device and the corresponding addresses.

**Table 8. Register mapping**

Name	Type	Register address		Default	Note
		Hex	Binary		
Reserved	--	00-0E	--	--	Reserved
WHO_AM_I	r	0F	00001111	00010001	
Reserved	--	10-1F	--	--	Reserved
CTRL_REG1	r/w	20	00100000	00000000	
INT1_CTRL	r/w	21	00100001	00000000	
INT2_CTRL	r/w	22	00100010	00000000	
CTRL_REG4	r/w	23	00100011	00000000	
CTRL_REG5	r/w	24	00100100	00000000	
OUT_TEMP_L	r	25	00100101	output	
OUT_TEMP_H	r	26	00100110	output	
STATUS	r	27	00100111	output	
OUT_X_L_XL	r	28	00101000	output	
OUT_X_H_XL	r	29	00101001	output	
OUT_Y_L_XL	r	2A	00101010	output	
OUT_Y_H_XL	r	2B	00101011	output	
OUT_Z_L_XL	r	2C	00101100	output	
OUT_Z_H_XL	r	2D	00101101	output	
FIFO_CTRL	r/w	2E	00101110	00000000	
FIFO_SRC	r	2F	00101111	output	
Reserved	--	30-32	--	--	Reserved

Registers marked as *Reserved* must not be changed. Writing to those registers may affect the correct behavior of the device.

Their content is automatically restored when the device is powered up.

## 7 Register description

The device contains a set of registers which are used to control its behavior and to retrieve linear acceleration and temperature data. The register addresses, consisting of 7 bits, are used to identify them and to write the data through the serial interface.

### 7.1 WHO\_AM\_I (0Fh)

Device identification register.

**Table 9. WHO\_AM\_I register**

0	0	0	1	0	0	0	1
---	---	---	---	---	---	---	---

### 7.2 CTRL\_REG1 (20h)

Control register 1.

**Table 10. CTRL\_REG1 register**

NORM_ MOD_EN	IF_ADD_ INC	0 <sup>(1)</sup>	0 <sup>(1)</sup>	BOOT	SW_RESET	DRDY_ PULSE	BDU
-----------------	----------------	------------------	------------------	------	----------	----------------	-----

1. These bits must be set to '0' for the correct operation of the device.

**Table 11. CTRL\_REG1 register description**

NORM_ MOD_EN	Normal mode enable. Default value: 0 (0: power down; 1: enabled)
IF_ADD_ INC	Register address automatically incremented during a multiple byte access with SPI serial interface. Default value: 1 (0: disabled; 1: enabled)
BOOT	Reboot memory content. Default value: 0 (0: normal mode; 1: reboot memory content <sup>(1)</sup> )
SW_RESET	Software reset. Default value: 0 With SW_RESET the values in the writable CTRL registers are changed to the default values. (0: normal mode; 1: reset device) This bit is cleared by hardware at the end of the operation.
DRDY_ PULSE	Data ready on INT1 pin. Default value: 0 (0: DRDY latched; 1: DRDY pulsed, pulse duration is 1/4 ODR)
BDU	Block Data Update. Default value: 0 (0: continuous update; 1: output registers not updated until MSB and LSB read)

1. Boot request is executed as soon as the internal oscillator is turned on. It is possible to set the bit while in power-down mode, in this case it will be served at the next normal mode.

### 7.3 INT1\_CTRL (21h)

INT1 pin control register.

**Table 12. INT1\_CTRL register**

INT1_DRDY	INT1_BOOT	INT1_OVR	INT1_FSS5	INT1_FTH	INT1_EXT	0 <sup>(1)</sup>	0 <sup>(1)</sup>
-----------	-----------	----------	-----------	----------	----------	------------------	------------------

1. These bits must be set to '0' for the correct operation of the device.

**Table 13. INT1\_CTRL register description**

INT1_DRDY	Accelerometer data ready on INT1 pin. Default value: 0 (0: disabled; 1: enabled)
INT1_BOOT	Boot status available on INT1 pin. Default value: 0 (0: disabled; 1: enabled)
INT1_OVR	Overflow flag on INT1 pin. Default value: 0 (0: disabled; 1: enabled)
INT1_FSS5	FSS5 full FIFO flag on INT1 pin. Default value: 0 (0: disabled; 1: enabled)
INT1_FTH	FIFO threshold flag on INT1 pin. Default value: 0 (0: disabled; 1: enabled)
INT1_EXT	INT1 pin configuration. Default value: 0 It configures the INT1 pad as output for FIFO flags or as external asynchronous input trigger to FIFO. INT2 pad is always available as output for FIFO flags. (0: INT1 as output interrupt; 1: INT1 as input channel)

### 7.4 INT2\_CTRL (22h)

INT2 pin control register.

**Table 14. INT2\_CTRL register**

INT2_DRDY	INT2_BOOT	INT2_OVR	INT2_FSS5	INT2_FTH	0 <sup>(1)</sup>	0 <sup>(1)</sup>	0 <sup>(1)</sup>
-----------	-----------	----------	-----------	----------	------------------	------------------	------------------

1. These bits must be set to '0' for the correct operation of the device.

**Table 15. INT2\_CTRL register description**

INT2_DRDY	Accelerometer data ready on INT2 pin. Default value: 0 (0: disabled; 1: enabled)
INT2_BOOT	Boot status available on INT2 pin. Default value: 0 (0: disabled; 1: enabled)
INT2_OVR	Overflow flag on INT2 pin. Default value: 0 (0: disabled; 1: enabled)
INT2_FSS5	FSS5 full FIFO flag on INT2 pin. Default value: 0 (0: disabled; 1: enabled)
INT2_FTH	FIFO threshold flag on INT2 pin. Default value: 0 (0: disabled; 1: enabled)

## 7.5 CTRL\_REG4 (23h)

Control register 4.

**Table 16. CTRL\_REG4 register**

DSP_LP_TYPE	DSP_BW_SEL	ST2	ST1	PP_OD_INT2	PP_OD_INT1	FIFO_EN	1 <sup>(1)</sup>
-------------	------------	-----	-----	------------	------------	---------	------------------

1. This bit must be set to '1' for correct operation of the device.

**Table 17. CTRL\_REG4 register description**

DSP_LP_TYPE	Digital filtering selection. Default value: 0 (0: FIR Linear Phase; 1: IIR Nonlinear Phase)
DSP_BW_SEL	User-selectable bandwidth. Default value: 0 (0: 440 Hz typ.; 1: 235 Hz typ.)
ST [2:1]	Self-test enable. Default value: 00 (00: Self-test disabled; Other: See <a href="#">Table 18</a> )
PP_OD_INT2	Push-pull/open drain selection on INT2 pin. Default value: 0 (0: push-pull mode; 1: open drain mode)
PP_OD_INT1	Push-pull/open drain selection on INT1 pin. Default value: 0 (0: push-pull mode; 1: open drain mode)
FIFO_EN	FIFO memory enable. Default value: 0 (0: disabled; 1: enabled)

**Table 18. Self-test mode selection**

ST2	ST1	Self-test mode
0	0	Normal mode
0	1	Positive sign self-test
1	0	Negative sign self-test
1	1	Not allowed

## 7.6 CTRL\_REG5 (24h)

Control register 5.

**Table 19. CTRL\_REG5 register**

0 <sup>(1)</sup>	0 <sup>(1)</sup>	0 <sup>(1)</sup>	0 <sup>(1)</sup>	0 <sup>(1)</sup>	0 <sup>(1)</sup>	0 <sup>(1)</sup>	FIFO_SPI_HS_ON
------------------	------------------	------------------	------------------	------------------	------------------	------------------	----------------

1. These bits must be set to '0' for correct operation of the device.

**Table 20. CTRL\_REG5 register description**

FIFO_SPI_HS_ON	Enables the SPI high speed configuration for the FIFO block that is used to guarantee a minimum duration of the window in which writing operation of RAM output is blocked. This bit is recommended for SPI clock frequencies higher than 6 MHz. Default value: 0. (0: not enabled; 1: enabled)
----------------	--

## 7.7 OUT\_TEMP\_L (25h), OUT\_TEMP\_H (26h)

Temperature data output register. L and H registers together express a 16-bit word in two's complement left-justified.

**Table 21. OUT\_TEMP\_L register**

Temp3	Temp2	Temp1	Temp0	0	0	0	0
-------	-------	-------	-------	---	---	---	---

**Table 22. OUT\_TEMP\_H register**

Temp11	Temp10	Temp9	Temp8	Temp7	Temp6	Temp5	Temp4
--------	--------	-------	-------	-------	-------	-------	-------

**Table 23. OUT\_TEMP register description**

Temp [11:0]	Temperature sensor output data. The value is expressed as two's complement sign. 0 LSB represents T=25 °C ambient.
-------------	--

## 7.8 STATUS (27h)

Status register (r)

**Table 24. Status register**

ZYXOR	ZOR	YOR	XOR	ZYXDA	ZDA	YDA	XDA
-------	-----	-----	-----	-------	-----	-----	-----

**Table 25. Status register description**

ZYXOR	Logic OR of the single X-, Y- and Z-axis data overrun. Default value: 0 (0: no overrun has occurred; 1: a new set of data has overwritten the previous set)
ZOR	Z-axis data overrun. Default value: 0 (0: no overrun has occurred; 1: new data for the Z-axis has overwritten the previous data)
YOR	Y-axis data overrun. Default value: 0 (0: no overrun has occurred; 1: new data for the Y-axis has overwritten the previous data)
XOR	X-axis data overrun. Default value: 0 (0: no overrun has occurred; 1: new data for the X-axis has overwritten the previous data)
ZYXDA	Logic AND of the single X-, Y- and Z-axis new data available. Default value: 0 (0: a new set of data is not yet available; 1: a new set of data is available)
ZDA	Z-axis new data available. Default value: 0 (0: new data for the Z-axis is not yet available; 1: new data for the Z-axis is available)
YDA	Y-axis new data available. Default value: 0 (0: new data for the Y-axis is not yet available; 1: new data for the Y-axis is available)
XDA	X-axis new data available. Default value: 0 (0: new data for the X-axis is not yet available; 1: new data for the X-axis is available)

## 7.9 OUT\_X (28h - 29h)

Linear acceleration sensor X-axis output register. The value is expressed as a 16-bit word in two's complement.

## 7.10 OUT\_Y (2Ah - 2Bh)

Linear acceleration sensor Y-axis output register. The value is expressed as a 16-bit word in two's complement.

## 7.11 OUT\_Z (2Ch - 2Dh)

Linear acceleration sensor Z-axis output register. The value is expressed as a 16-bit word in two's complement.

## 7.12 FIFO\_CTRL (2Eh)

FIFO control register.

**Table 26. FIFO\_CTRL register**

FMODE2	FMODE1	FMODE0	FTH4	FTH3	FTH2	FTH1	FTH0
--------	--------	--------	------	------	------	------	------

**Table 27. FIFO\_CTRL register description**

FMODE [2:0]	FIFO mode selection bits. Default value: 000 For further details refer to <a href="#">Table 28</a> .
FTH [4:0]	FIFO threshold level setting. Default value: 0 0000

**Table 28. FIFO mode selection**

FMODE2	FMODE1	FMODE0	Mode
0	0	0	Bypass mode. FIFO turned off
0	0	1	FIFO mode. Stops collecting data when FIFO is full.
0	1	0	Reserved
0	1	1	Continuous mode until trigger is asserted, then FIFO mode.
1	0	0	Bypass mode until trigger is asserted, then Continuous mode.
1	0	1	Reserved
1	1	0	Continuous mode. If the FIFO is full, the new sample overwrites the older sample.
1	1	1	Reserved

### 7.13 FIFO\_SRC (2Fh)

FIFO status register.

**Table 29. FIFO\_SRC register**

FTH	OVRN	FSS5	FSS4	FSS3	FSS2	FSS1	FSS0
-----	------	------	------	------	------	------	------

**Table 30. FIFO\_SRC register description**

FTH	FIFO threshold status. (0: FIFO filling is lower than threshold level; 1: FIFO filling is equal to or higher than the threshold level)
OVRN	FIFO overrun status. (0: FIFO is not completely filled; 1: FIFO is completely filled and at least one sample has been overwritten) For further details refer to <a href="#">Table 31</a> .
FSS [5:0]	Number of unread samples stored in FIFO. (000000: FIFO empty; 100000: FIFO full, 32 unread samples) For further details refer to <a href="#">Table 31</a> .

**Table 31. FIFO\_SRC example: OVR/FSS details**

FTH	OVRN	FSS5	FSS4	FSS3	FSS2	FSS1	FSS0	Description
0	0	0	0	0	0	0	0	FIFO empty
..(1)	0	0	0	0	0	0	1	1 unread sample
...								
..(1)	0	1	0	0	0	0	0	32 unread samples
0(1)	1	1	0	0	0	0	0	At least one sample has been overwritten

1. When the number of unread samples in FIFO is equal to or greater than the threshold level set in register [FIFO\\_CTRL \(2Eh\)](#), the FTH value is '1'.

The FSS is the FIFO stored data level of the unread samples. When it is equal to FTH, all data available in FIFO are read without additional read operations.

The INT output is high when the number of samples to read is equal to or greater than FTH.

**Figure 16. Continuous mode: FTH/FSS details**
