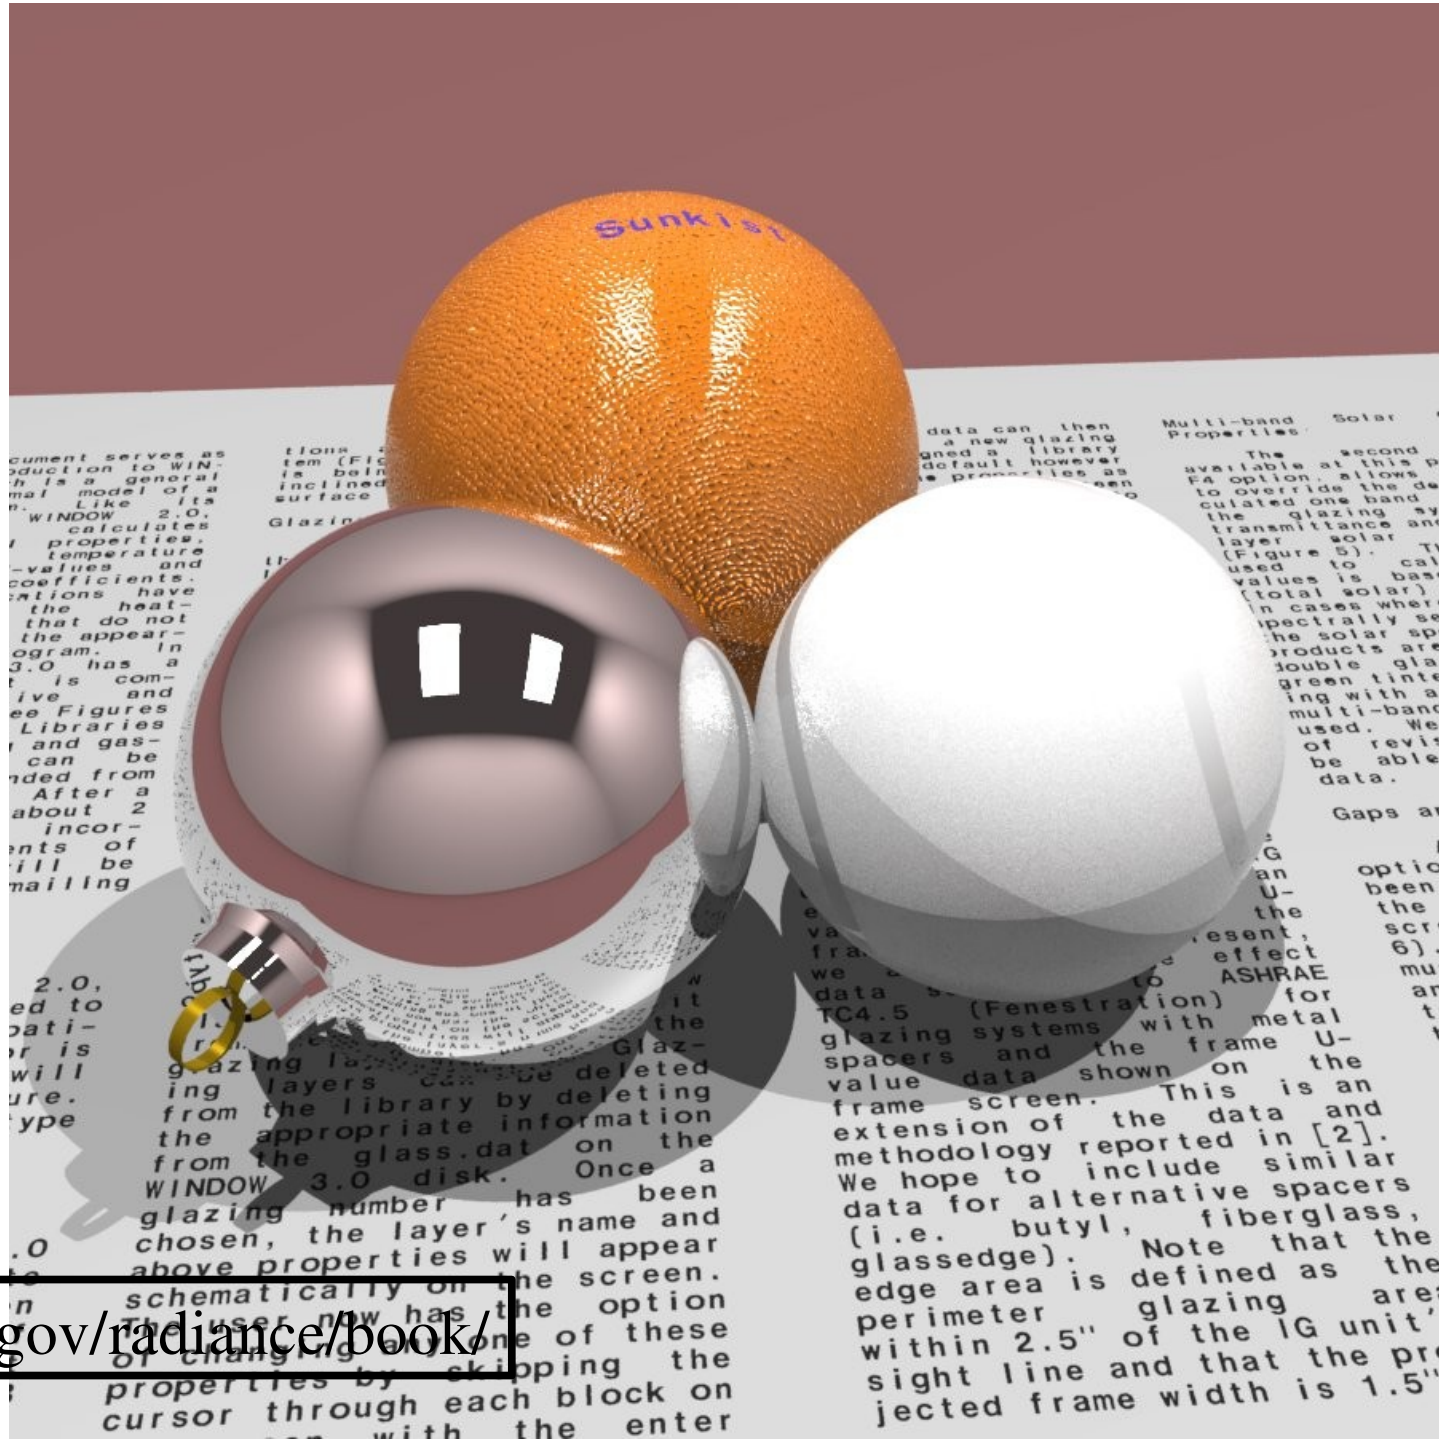
Ray tracing

EECS 487

March 19, 2007



http://radsite.lbl.gov/radiance/book/

Conventional pipeline (rasterization)

- For each triangle
  - Compute lighting at vertices
  - For each pixel within triangle
    - Compute interpolated color and depth
    - Write pixel if depth test passes
- Q: the above description is somewhat “old style”
  - how have things changed lately?

Conventional pipeline (rasterization)

- For each triangle
  - Compute lighting at vertices
  - For each pixel within triangle
    - Compute interpolated color and depth
    - Write pixel if depth test passes
- Q: the above description is somewhat “old style”
  - how have things changed lately?
- A: can now do per-pixel lighting

Advantages of conventional pipeline

- Simple
- Can be implemented in hardware
  - Parallel processing (SIMD)
  - Vertices
  - Pixels
- Visibility determination is fast
  - z-buffer

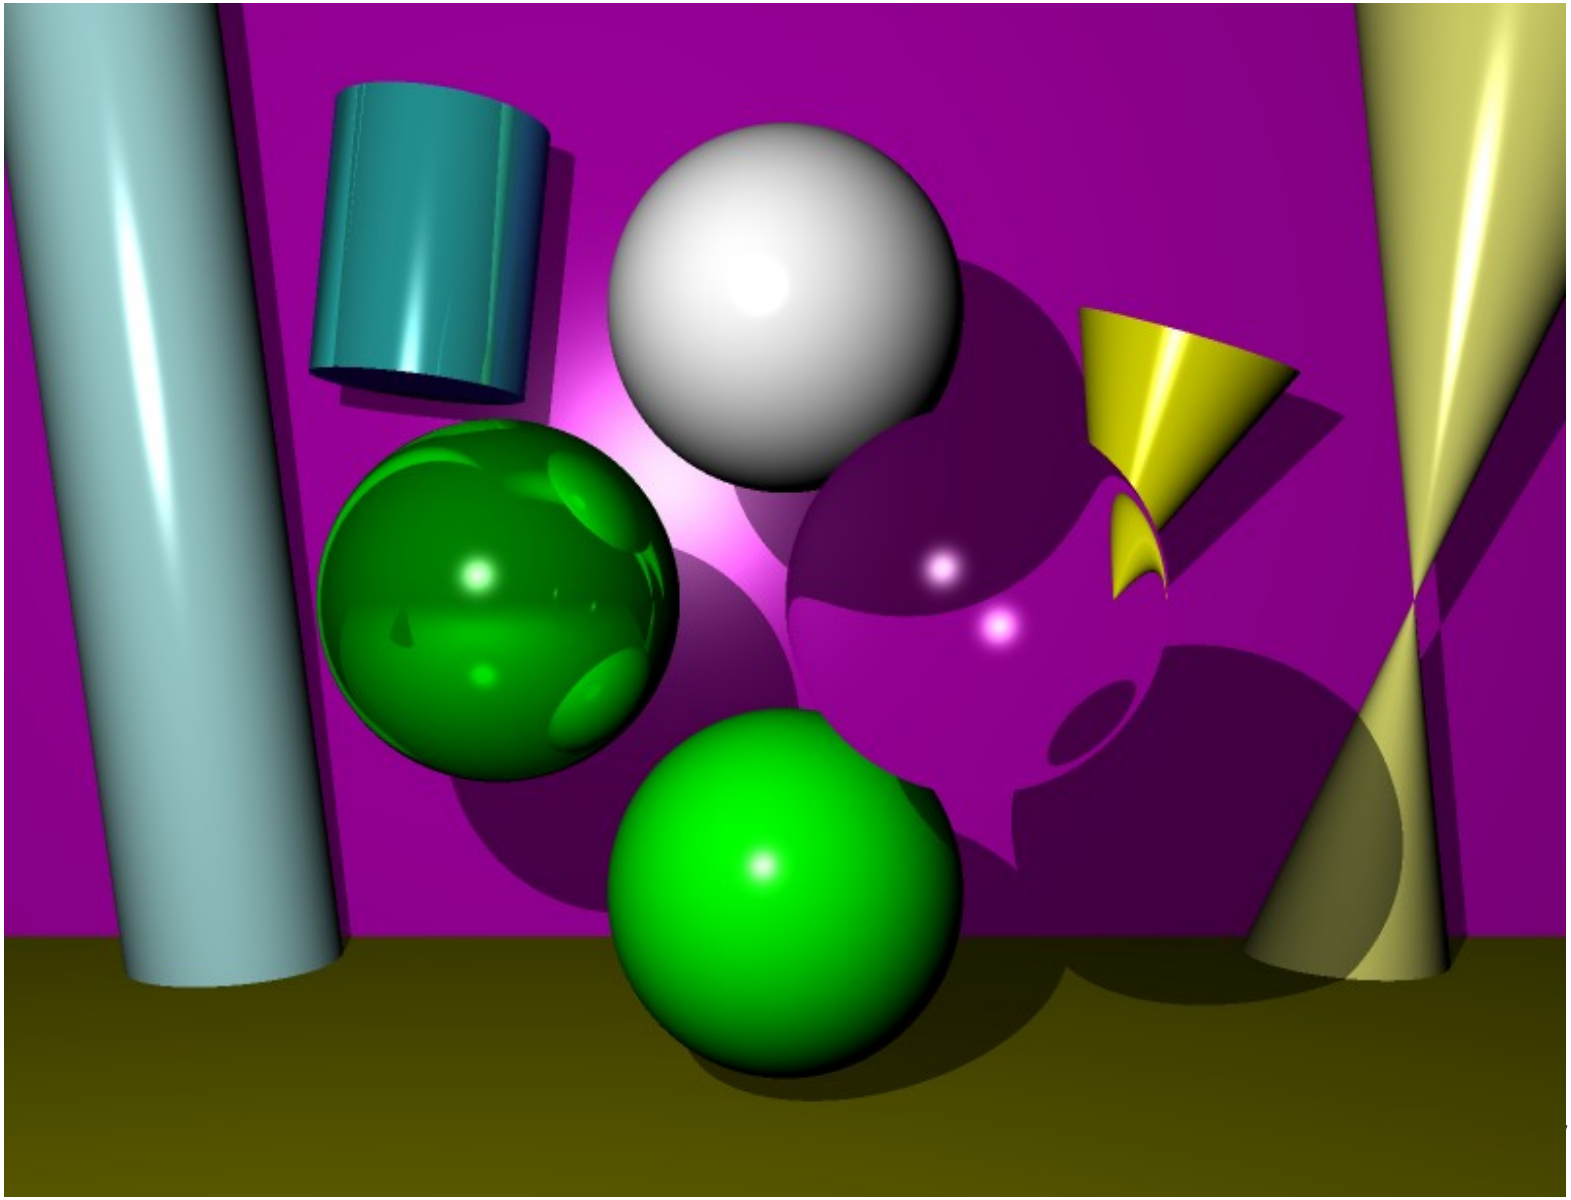
Disadvantages

- Missing effects
  - namely?

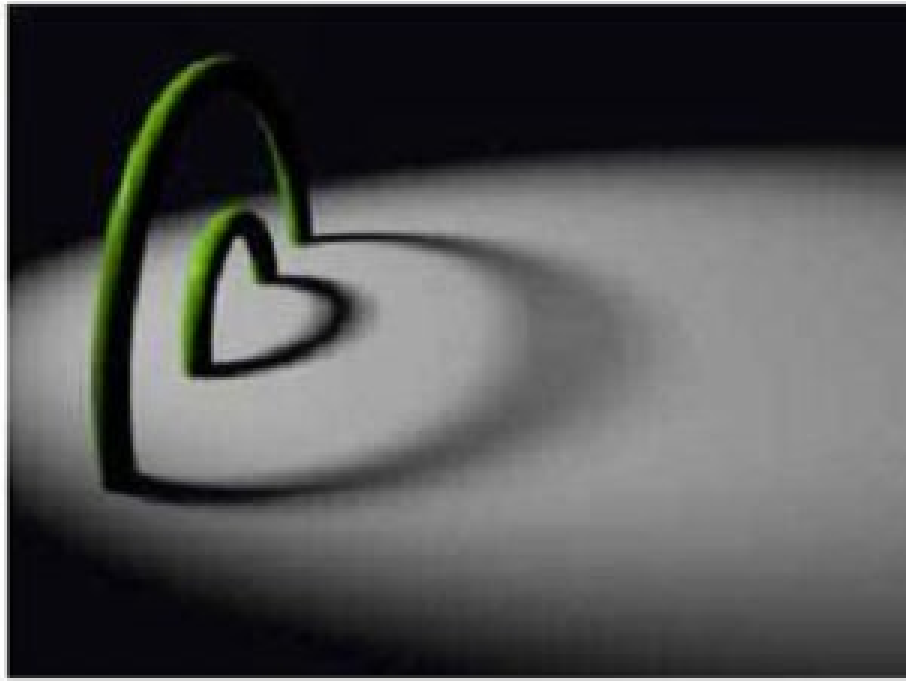
Disadvantages

- Missing effects
  - shadows
  - reflection
  - refraction through transparent surfaces
  - color bleeding
  - depth of field
  - motion blur
  - caustics
- Undesirable effect: Aliasing

Refraction, hard shadows, reflection

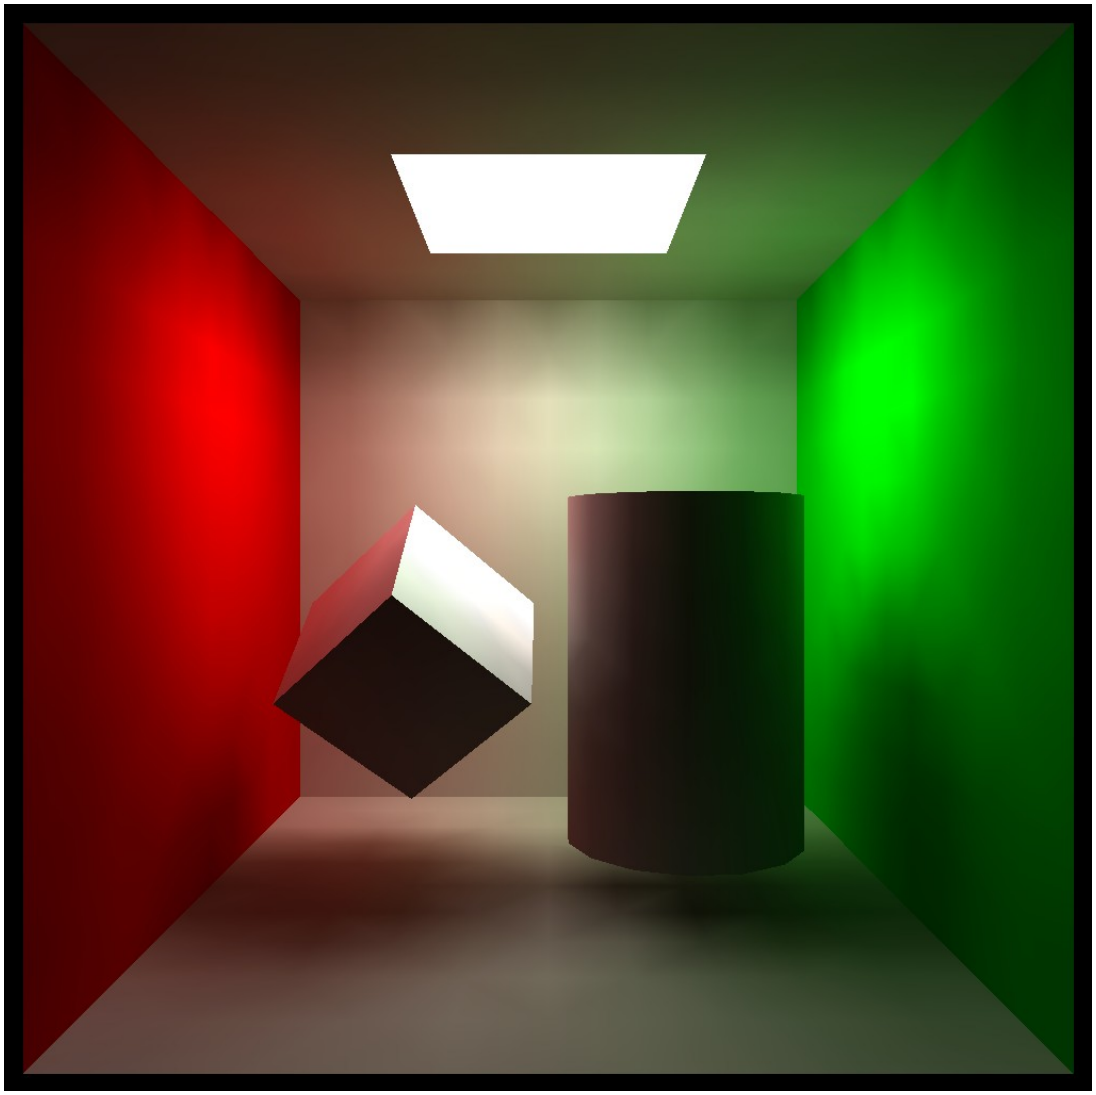


Soft shadows



http://www-csl.csres.utexas.edu/users/billmark/teach/cs384g-05-fall/projects/ray/ray_examples/

Color bleeding



Depth of field

From today's New York Times

Motion blur

Caustics

Degrees of ray-tracing

- Ray-casting
  - same disadvantages as rasterization, but slower!
- Classical ray-tracing (today)
  - extension of ray-casting (slower still)
- Monte carlo ray-tracing (next class)
  - extension of classical ray-tracing (waaaay slower)

Ray-casting

- For each *pixel*
  - Compute ray into scene
  - Find intersection with nearest object
    - Compute lighting (via position, normal)

Advantages of ray-casting

- Simple

Advantages of ray-casting

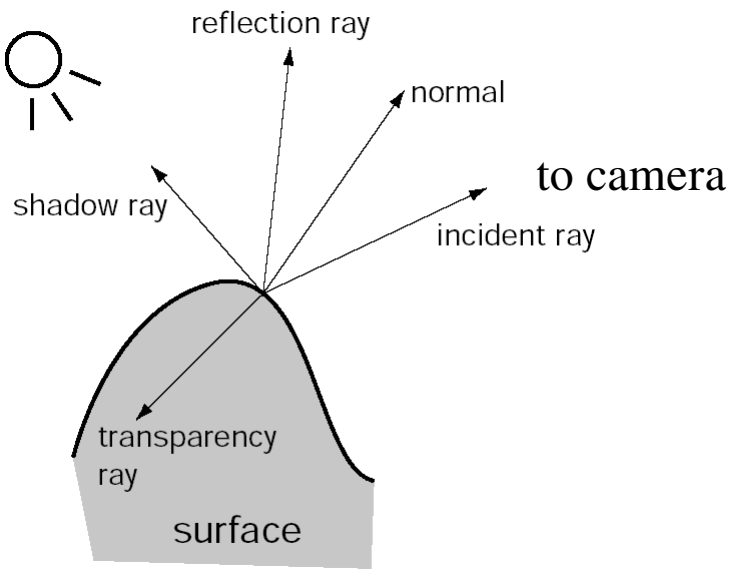
- Simple
- Can be extended to include global illumination effects:
  - Reflections (specular, glossy)
  - Shadows (hard, soft)
  - Depth of field
  - Motion blur
- Then it's called *ray-tracing*

Disadvantages of ray-tracing

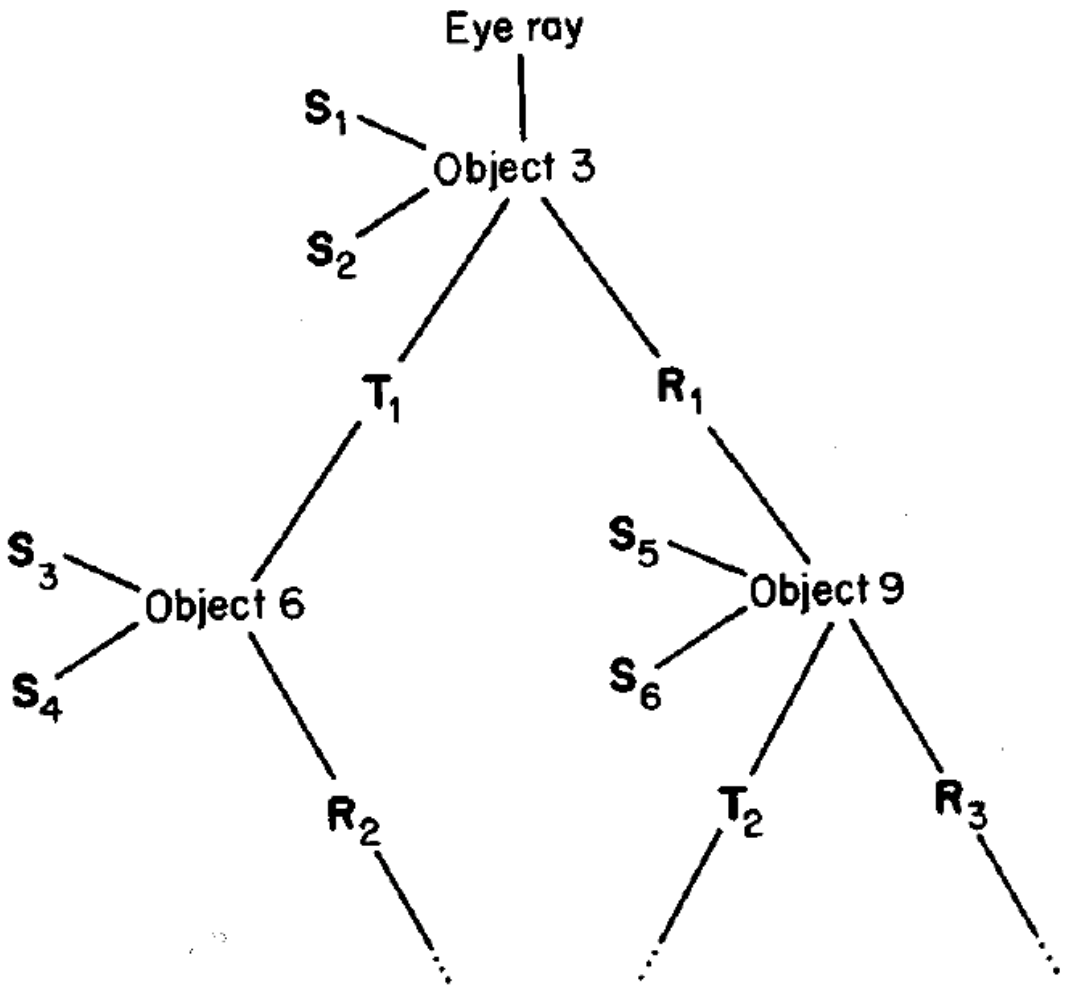
- Done in software: slower
- Adding realism can increase computations exponentially: monte carlo ray tracing, AKA distribution ray-tracing

Classical ray-tracing

- Primary ray
  - leaves the eye and travels out to the scene
- When hit - spawn three new rays to "collect light"
  - shadow ray
    - towards light
  - reflection ray
  - transparency ray



The ray tree

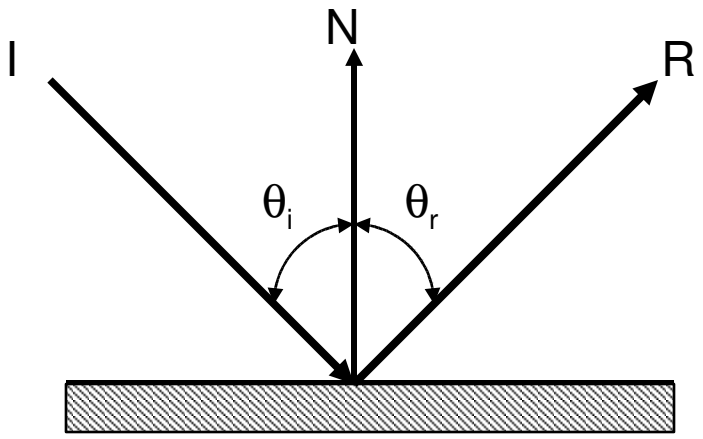


Raytracing is recursive

- I(incident-out) =
  I(shadow-local-in)
  + Kr * I(reflection-in)
  + Kt * I(transparent-in)

  - what is a range of Kr and Kt?
- Without recursion we have ray casting

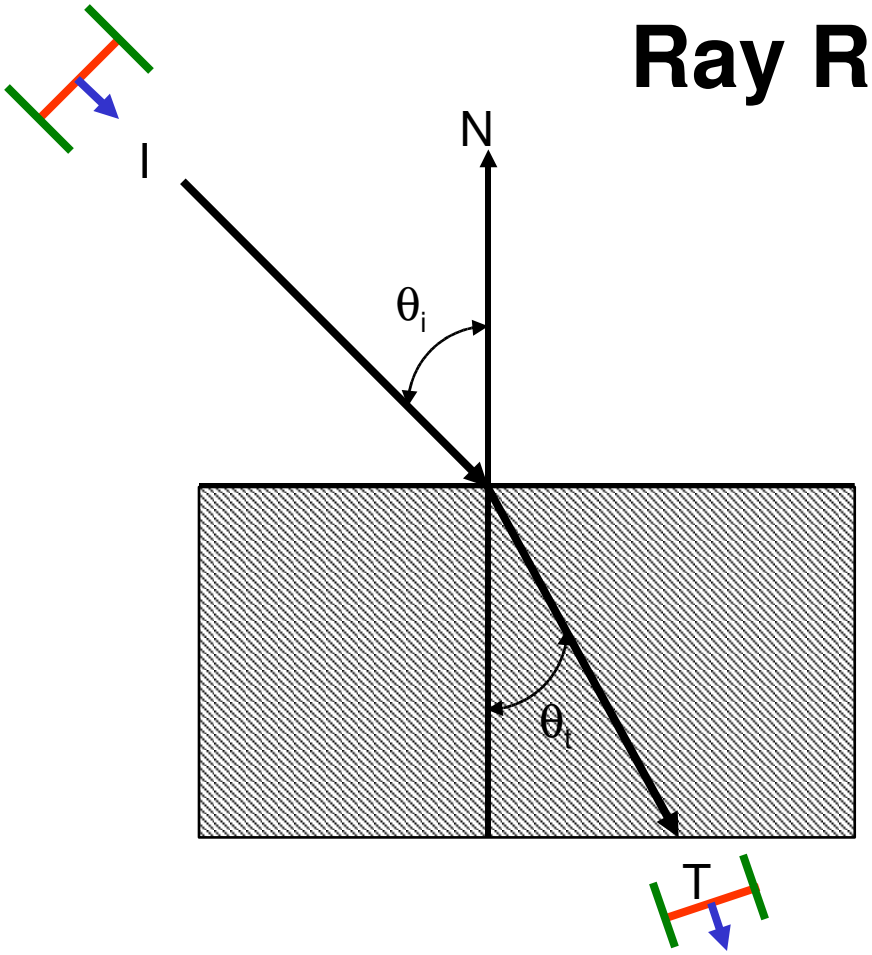
Ray Reflections



$$\theta_I = \theta_r$$

$$\vec{R} = \vec{I} - 2(\vec{N} \bullet \vec{I})\,\vec{N}$$

Ray Refraction



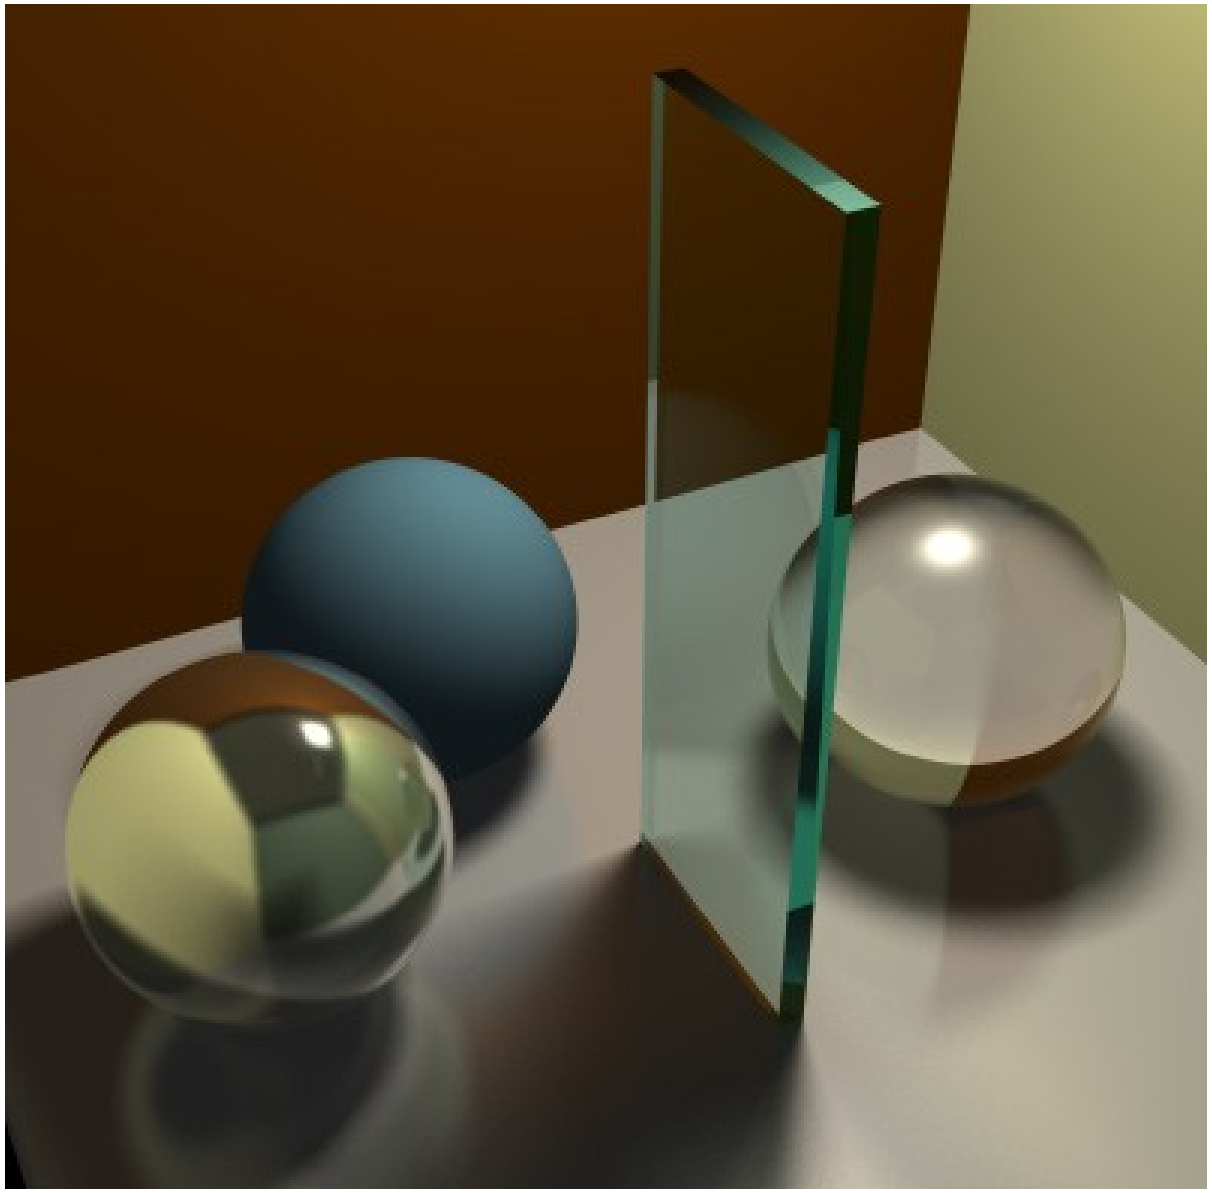
Snell's Law

$$\frac{\sin(\theta_i)}{\sin(\theta_t)} = \eta_{21} = \frac{\eta_2}{\eta_1}$$

Index of refraction: ratio of speed of light in a vacuum to speed in the material

Light Attenuation in transparent materials

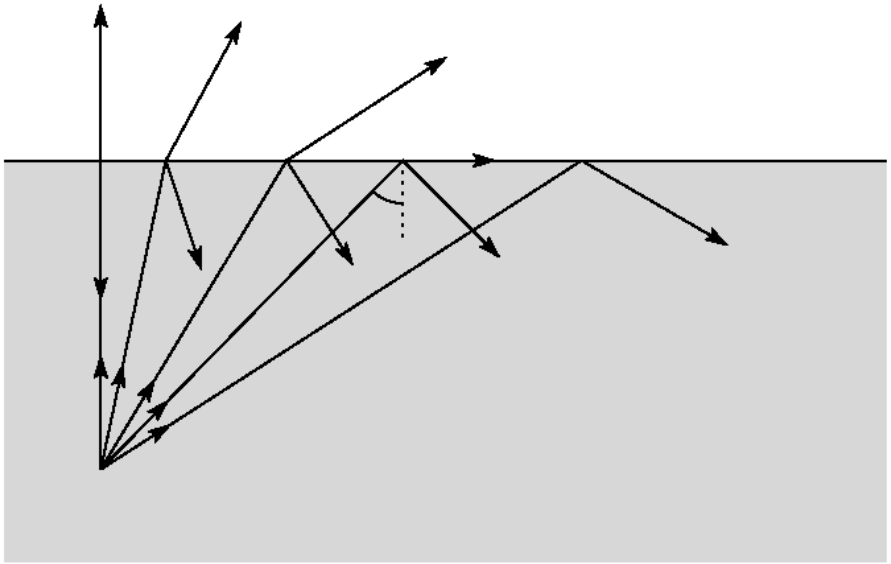
- Light may lose intensity and shift color
  - effect increases with distance
- Beer's law
  - Fall-off is exponential w/ distance
  - r, g, b components computed separately
  - text has details



http://www.jasonwaltman.com/graphics/rt-soft-fuzzy.html

Watch out for…

- Total internal refraction
  - light may not get through the interface



Computing intersections

- Crucial computation (inner loop)
- Spheres
- Planes
- CSGs

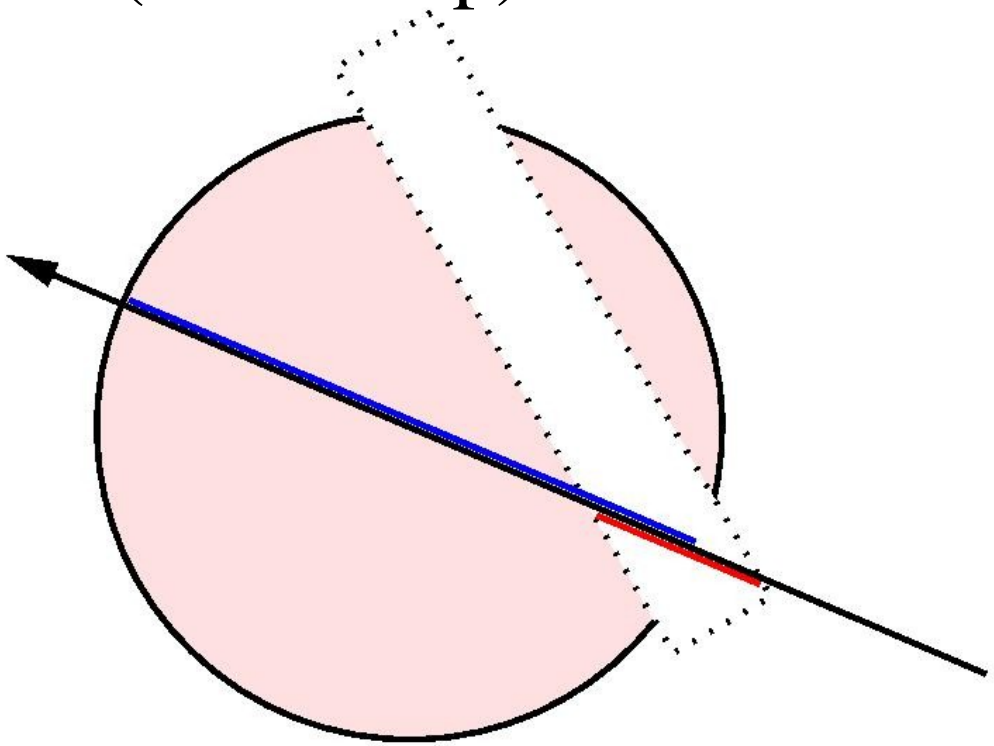


image from: http://groups.csail.mit.edu/graphics/classes/6.838/F01/lectures/SmoothSurfaces/csg-raytrace.gif

pop quiz

- given ray: $\mathbf{r}(t) = \mathbf{p} + t\mathbf{d}$

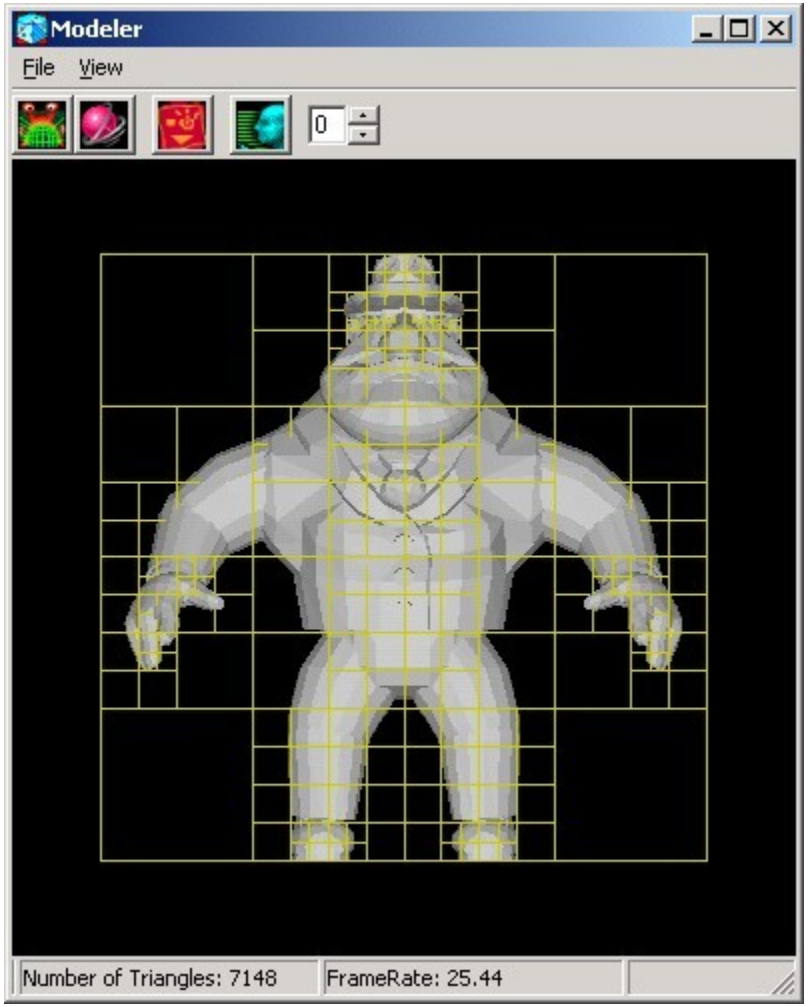
  where **p** is the ray origin,

  d is a vector along the ray

- find the value of t for which $\mathbf{r}(t)$ lies on the unit sphere with center at the origin

Speed-up techniques

- Bounding volumes
  - Spheres
  - Boxes
- Uniform spatial subdivision
- Hierarchical bounding boxes

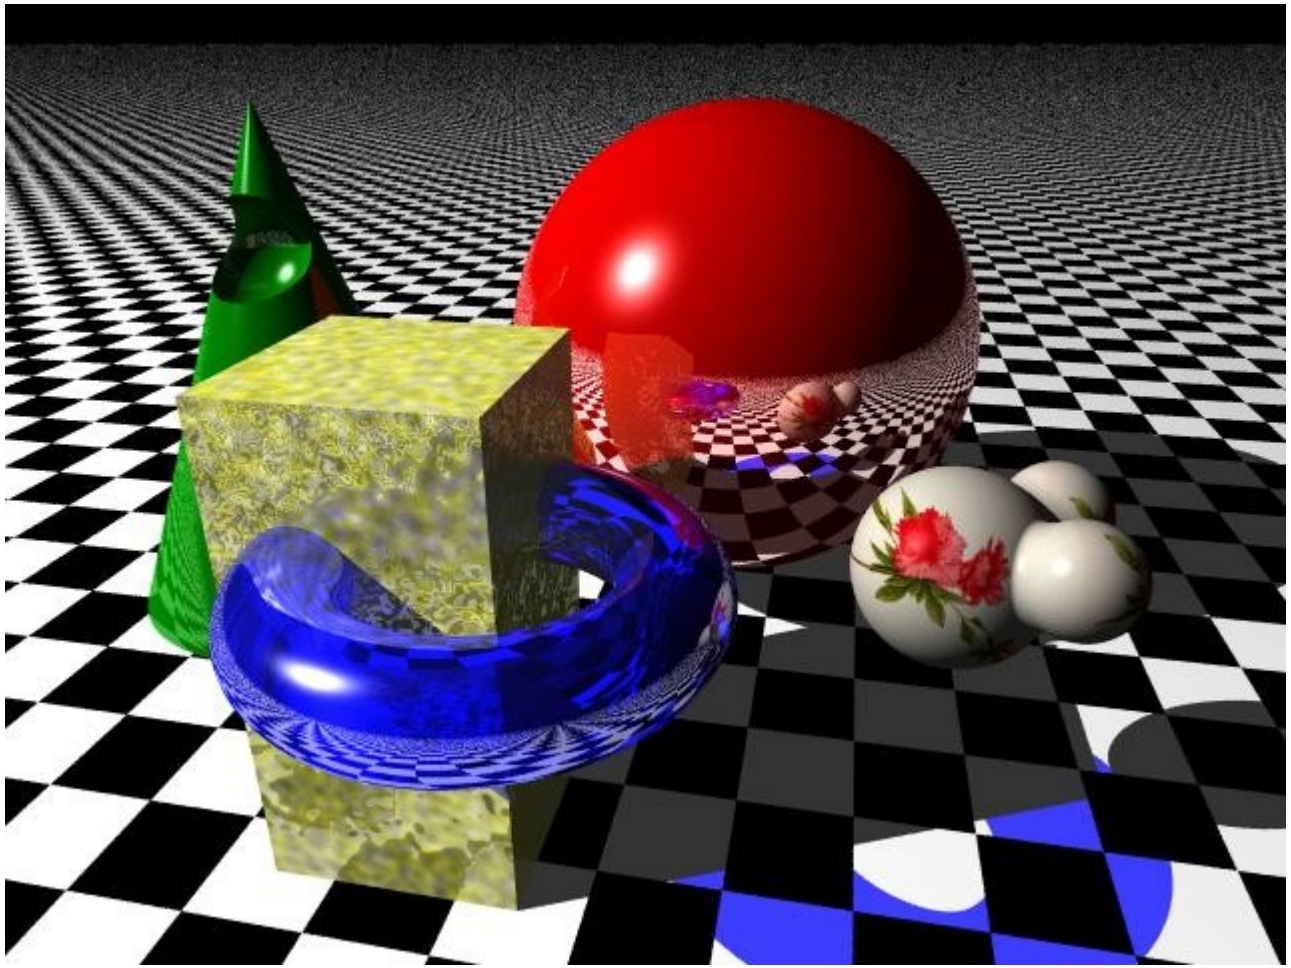


Using hierarchical bounding boxes

To check for intersections w/ objects in box:

- if ray misses box, return none
- if box is “leaf” test intersections w/ each triangle stored in the box, return closest
- else check for intersections w/ each child box, return closest

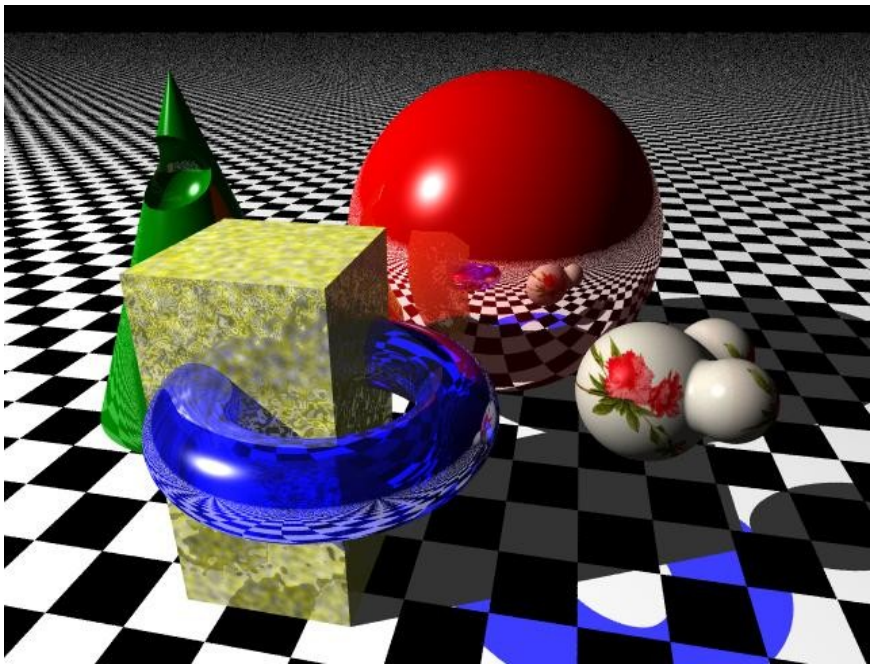
Problem (classical ray tracing): images are too clean



http://www.tjhsst.edu/~dhyatt/supercomp/p501.html

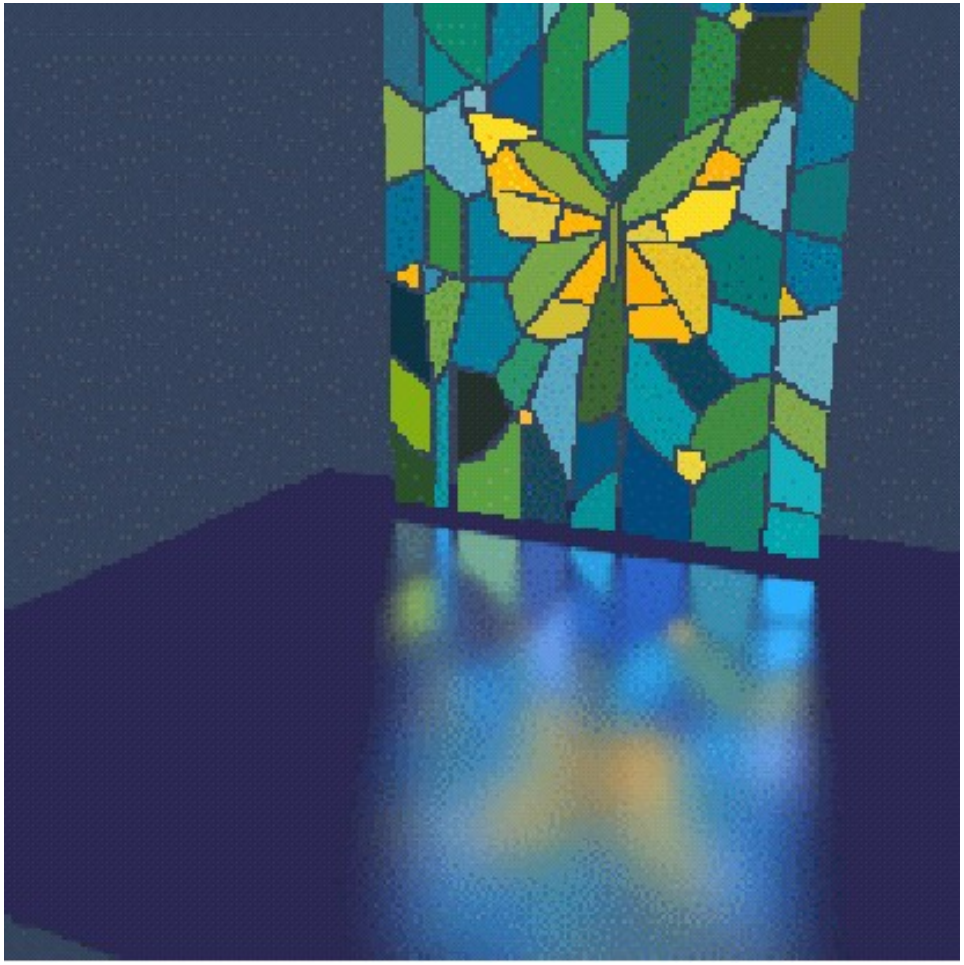
What's missing

- Reflections are perfect
- Shadows are hard
- Everything is in focus
- Shutter speed is infinite
- Prone to aliasing



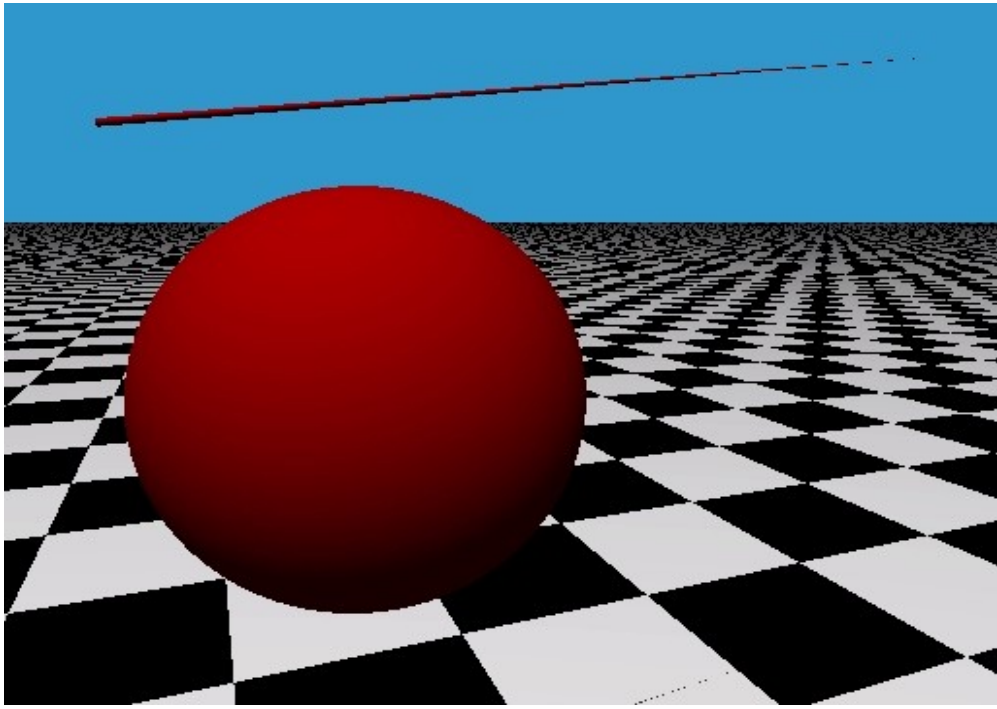
Strategy: random sampling

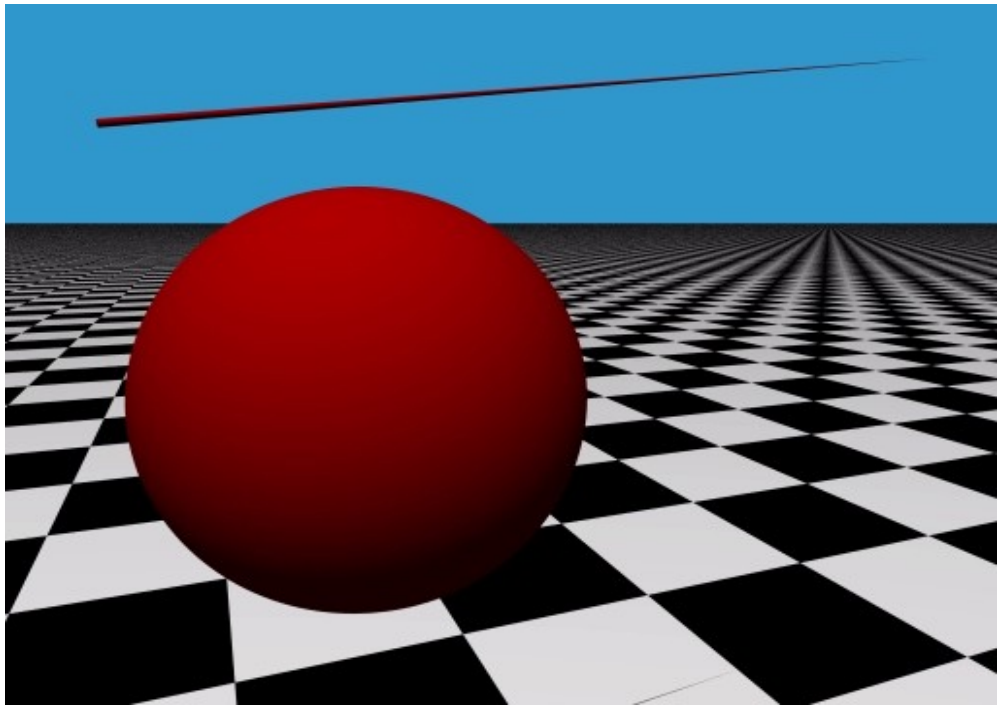
Can address all problems listed on previous slide



anti-aliasing

- many rays per pixel
  - regular sampling
  - random sampling
- more on this next time

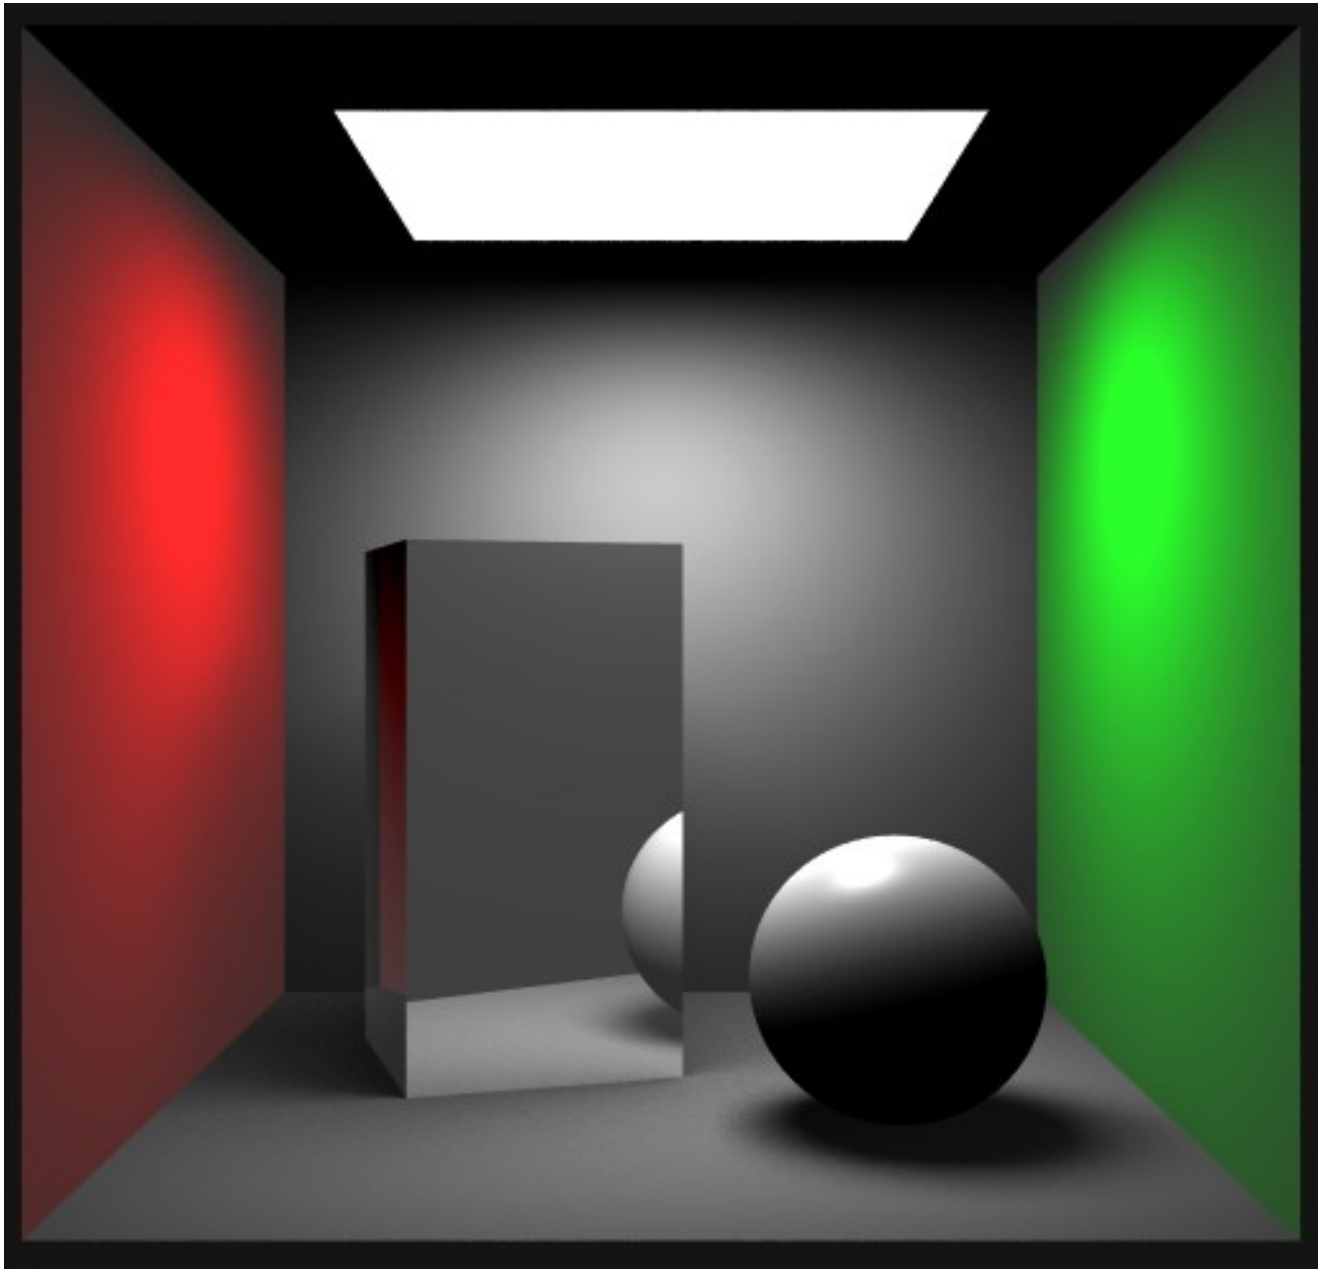




soft shadows

- one approach: use many lights
  - approximate an area light with many point lights
  - problem: overlapping hard shadows

- alternate approach:
  - sample the area light randomly w/ rays
  - random sampling discussed in text



http://www.cs.wpi.edu/~emmanuel/courses/cs563/write_ups/zackw/realistic_raytracing.html

more effects

- glossy reflection
  - follow multiple reflection rays, jittered randomly
- motion blur
  - multiple rays, jittered in time
- depth of field
  - multiple rays, jittered around eye, through focal plane
- more details next class

Wrap up

- Shirley (our textbook) has details on computing random samples effectively
- Project 5 (ray tracing) will go out next week
- Guest speaker next week:
  Manoj Rajagopalan
- I'll be out of town
  - no office hours
