

EECS 498-003 Intro Distributed Systems TuTh 1:30-3:00 Winter 2017

Distributed systems are ubiquitous today:

- Data centers deployments across the globe for web services to serve users from nearby data centers
- Distributed frameworks to store and process data across all servers within a data center
- Syncing of data and application state between mobile devices and the cloud

In this class, you will learn the core principles and techniques that apply across all of these scenarios to maximize performance, reliability, efficiency, etc.
