Walk through of the ARM ISA

Software Development Tool Flow

Application Binary Interface (ABI)

Major elements of an Instruction Set Architecture

(registers, memory, word size, endianness, conditions, instructions, addressing modes)

The endianness religious war: 288 years and counting!

- Modern version

- Danny Cohen
- IEEE Computer, v14, #10
- Published in 1981
- Satire on CS religious war

- Little-Endian

- LSB is at lower address

	Memory Offset	Value (LSB) (MSB)
	=====	=====
<code>uint8_t a = 1;</code>	0x0000	01 02 FF 00
<code>uint8_t b = 2;</code>		
<code>uint16_t c = 255; // 0x00FF</code>		
<code>uint32_t d = 0x12345678;</code>	0x0004	78 56 34 12

- Historical Inspiration

- Jonathan Swift
- *Gulliver's Travels*
- Published in 1726
- Satire on Henry-VIII's split with the Church
 - Now a major motion picture!

- Big-Endian

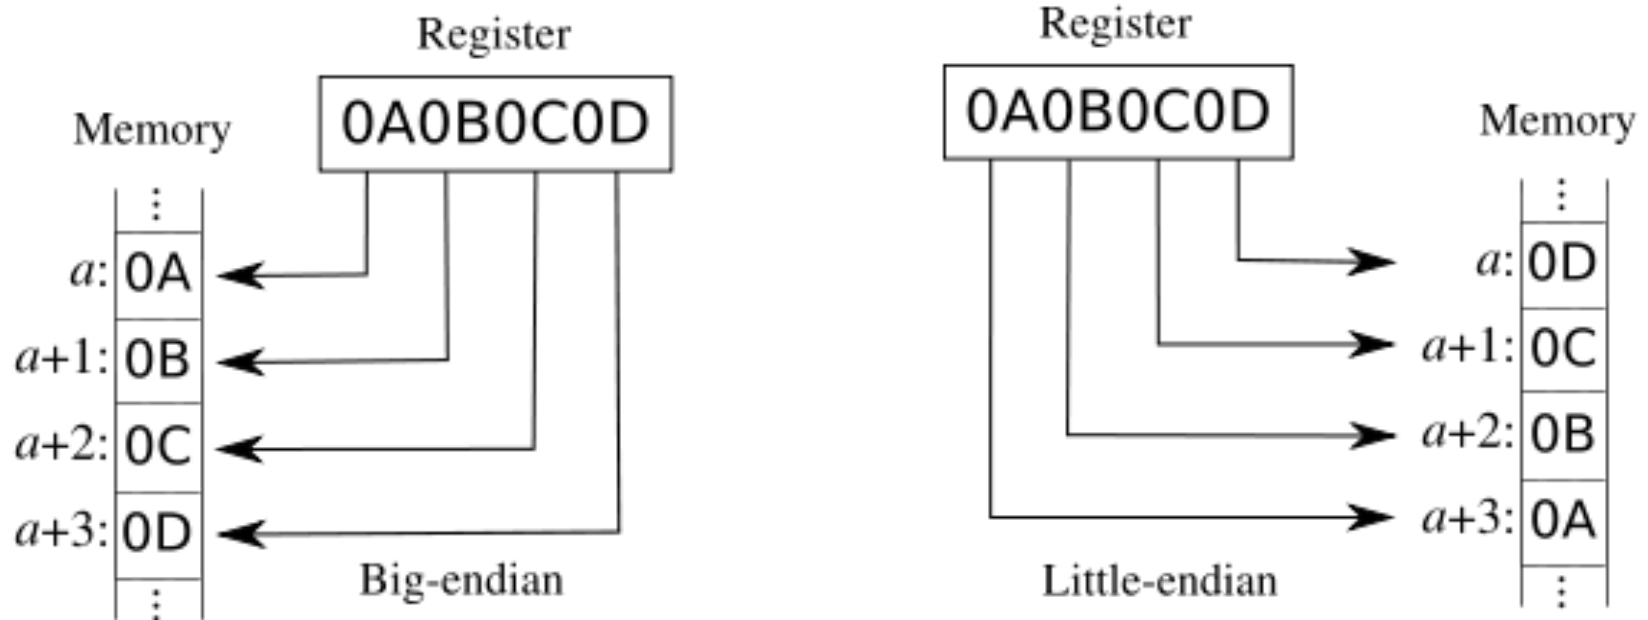

- MSB is at lower address

	Memory Offset	Value (LSB) (MSB)
	=====	=====
<code>uint8_t a = 1;</code>	0x0000	01 02 00 FF
<code>uint8_t b = 2;</code>		
<code>uint16_t c = 255; // 0x00FF</code>		
<code>uint32_t d = 0x12345678;</code>	0x0004	12 34 56 78

Addressing: Big Endian vs Little Endian (370 slide)

- Endian-ness: ordering of bytes within a word
 - Little - increasing numeric significance with increasing memory addresses
 - Big - The opposite, most significant byte first
 - MIPS is big endian, x86 is little endian

ARM Cortex-M3 Memory Formats (Endian)

- Default memory format for ARM CPUs: LITTLE ENDIAN
- Bytes 0-3 hold the first stored word
- Bytes 4-7 hold the second stored word
- Processor contains a configuration pin BIGEND
 - Enables system developer to select format:
 - Little Endian
 - Big Endian (BE-8)
 - Pin is sampled on reset
 - Cannot change endianness when out of reset
- Source: [ARM TRM] ARM DDI 0337E, “Cortex-M3 Technical Reference Manual,” Revision r1p1, pg 67 (2-11).

Instruction encoding

- Instructions are encoded in machine language opcodes
- Sometimes
 - Necessary to hand generate opcodes
 - Necessary to verify assembled code is correct
- How? Refer to the “ARM ARM”

Instructions

```

```
add r4, r4, r2
```

```
add r0, r0, #1
```

```
cmp r0, #4
```

```
bne top
```

Instructions used

- **mov**
 - Moves data from register or immediate.
 - Or also from shifted register or immediate!
 - the mov assembly instruction maps to a bunch of different encodings!
 - If immediate it might be a 16-bit or 32-bit instruction
 - Not all values possible
 - why?
- **movw**
 - Actually an alias to mov
 - “w” is “wide”
 - hints at 16-bit immediate

From the ARMv7-M Architecture Reference Manual (posted on the website under references)

A6.7.76 MOV (register)

Move (register) copies a value from a register to the destination register. It can optionally update the condition flags based on the value.

Encoding T1 ARMv6-M, ARMv7-M If <Rd> and <Rm> both from R0-R7,
otherwise all versions of the Thumb ISA.
MOV<C> <Rd>, <Rm> If <Rd> is the PC, must be outside or last in IT block

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	1	0	0	0	1	1	0	D	Rm				Rd		

```
d = UInt(D:Rd); m = UInt(Rm); setflags = FALSE;  
if d == 15 && InITBlock() && !LastInITBlock() then UNPREDICTABLE;
```

Encoding T2 All versions of the Thumb ISA.
MOVS <Rd>, <Rm> ~~(formerly LSL <Rd>, <Rm>, #0)~~ Not permitted inside IT block

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	0	0	0	0	0	0	0	0	Rm				Rd	

```
d = UInt(Rd); m = UInt(Rm); setflags = TRUE;  
if InITBlock() then UNPREDICTABLE;
```

Encoding T3 ARMv7-M
MOV{S}<C>.W <Rd>, <Rm>

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
1	1	1	0	1	0	1	0	0	1	0	S	1	1	1	1	(0)	0	0	0	Rd				0	0	0	0	Rm			

```
d = UInt(Rd); m = UInt(Rm); setflags = (S == '1');  
if setflags && (d IN {13,15} || m IN {13,15}) then UNPREDICTABLE;  
if !setflags && (d == 15 || m == 15 || (d == 13 && m == 13)) then UNPREDICTABLE;
```

There are similar entries for
move immediate, move shifted
(which actually maps to different
instructions) etc.

Directives

- `#:lower16:data`
 - What does that do?
 - Why?
- Note:
 - “data” is a label for a memory address!

A6.7.78 MOVN

Move Top writes an immediate value to the top halfword of the destination register. It does not affect the contents of the bottom halfword.

Encoding T1 ARMv7-M

MOVN<C> <Rd>, #<imm16>

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
1	1	1	1	0	i	1	0	1	1	0	0	imm4				0	imm3				Rd				imm8							

```
d = UInt(Rd); imm16 = imm4:i:imm3:imm8;  
if d IN {13,15} then UNPREDICTABLE;
```

Assembler syntax

MOVN<C><Q> <Rd>, #<imm16>

where:

<C><Q> See *Standard assembler syntax fields* on page A6-7.

<Rd> Specifies the destination register.

<imm16> Specifies the immediate value to be written to <Rd>. It must be in the range 0-65535.

Operation

```
if ConditionPassed() then  
    EncodingSpecificOperations();  
    R[d]<31:16> = imm16;  
    // R[d]<15:0> unchanged
```

Loads!

- **ldrb -- Load register byte**
 - Note this takes an 8-bit value and moves it into a 32-bit location!
 - Zeros out the top 24 bits
- **ldrsh -- Load register signed byte**
 - Note this also takes an 8-bit value and moves it into a 32-bit location!
 - Uses sign extension for the top 24 bits

Addressing Modes

- Offset Addressing
 - Offset is added or subtracted from base register
 - Result used as effective address for memory access
 - [$\langle Rn \rangle$, $\langle \text{offset} \rangle$]
- Pre-indexed Addressing
 - Offset is applied to base register
 - Result used as effective address for memory access
 - Result written back into base register
 - [$\langle Rn \rangle$, $\langle \text{offset} \rangle$]!
- Post-indexed Addressing
 - The address from the base register is used as the EA
 - The offset is applied to the base and then written back
 - [$\langle Rn \rangle$], $\langle \text{offset} \rangle$

So what does the program `_do_`?

`data:`

`.byte 0x12, 20, 0x20, -1`

`func:`

`mov r0, #0`

`mov r4, #0`

`movw r1, #:lower16:data`

`movt r1, #:upper16:data`

`top: ldrb r2, [r1], #1`

`add r4, r4, r2`

`add r0, r0, #1`

`cmp r0, #4`

`bne top`

Today...

Finish ARM assembly example from last time

Walk through of the ARM ISA

Software Development Tool Flow

Application Binary Interface (ABI)

An ISA defines the hardware/software interface

- A “contract” between architects and programmers
- Register set
- Instruction set
 - Addressing modes
 - Word size
 - Data formats
 - Operating modes
 - Condition codes
- *Calling conventions*
 - Really not part of the ISA (usually)
 - Rather part of the ABI
 - But the ISA often provides meaningful support.

V7M (microcontroller) – HW
Divide and Thumb-2 only

+M4 : DSP ISA

A quick comment on the ISA:

From: ARMv7-M Architecture Reference Manual

A4.1 About the instruction set

ARMv7-M supports a large number of 32-bit instructions that were introduced as Thumb-2 technology into the Thumb instruction set. Much of the functionality available is identical to the ARM instruction set supported alongside the Thumb instruction set in ARMv6T2 and other ARMv7 profiles. This chapter describes the functionality available in the ARMv7-M Thumb instruction set, and the *Unified Assembler Language* (UAL) that can be assembled to either the Thumb or ARM instruction sets.

Thumb instructions are either 16-bit or 32-bit, and are aligned on a two-byte boundary. 16-bit and 32-bit instructions can be intermixed freely. Many common operations are most efficiently executed using 16-bit instructions. However:

- Most 16-bit instructions can only access eight of the general purpose registers, R0-R7. These are known as the low registers. A small number of 16-bit instructions can access the high registers, R8-R15.
- Many operations that would require two or more 16-bit instructions can be more efficiently executed with a single 32-bit instruction.

The ARM and Thumb instruction sets are designed to *interwork* freely. Because ARMv7-M only supports Thumb instructions, interworking instructions in ARMv7-M must only reference Thumb state execution, see *ARMv7-M and interworking support* for more details.

In addition, see:

- Chapter A5 *Thumb Instruction Set Encoding* for encoding details of the Thumb instruction set
- Chapter A6 *Thumb Instruction Details* for detailed descriptions of the instructions.

if d IN {13,15} then UNPREDICTABLE;

Branch

Table A4-1 Branch instructions

Instruction	Usage	Range
<i>B</i> on page A6-40	Branch to target address	+/-1 MB
<i>CBNZ</i> , <i>CBZ</i> on page A6-52	Compare and Branch on Nonzero, Compare and Branch on Zero	0-126 B
<i>BL</i> on page A6-49	Call a subroutine	+/-16 MB
<i>BLX</i> (<i>register</i>) on page A6-50	Call a subroutine, optionally change instruction set	Any
<i>BX</i> on page A6-51	Branch to target address, change instruction set	Any
<i>TBB</i> , <i>TBH</i> on page A6-258	Table Branch (byte offsets)	0-510 B
	Table Branch (halfword offsets)	0-131070 B

Branch examples

- `b target`
 - Branch without link (i.e. no possibility of return) to `target`
 - The PC is not saved!
- `bl func`
 - Branch with link (call) to function `func`
 - Store the return address in the link register (`lr`)
- `bx lr`
 - Use to return from a function
 - Moves the `lr` value into the `pc`
 - Could be a different register than `lr` as well
- `blx reg`
 - Branch to address specified by `reg`
 - Save return address in `lr`
 - When using `blx`, make sure lsb of `reg` is 1 (otherwise, the CPU will fault b/c it's an attempt to go into the ARM state)

Branch examples (2)

- `blx label`
 - Branch with link and exchange state. With immediate data, `blx` changes to ARM state. But since CM-3 does not support ARM state, **this instruction causes a fault!**
- `mov r15, r0`
 - Branch to the address contained in `r0`
- `ldr r15, [r0]`
 - Branch to the to address in memory specified by `r0`
- Calling `bl` **overwrites** contents of `lr`!
 - So, **save `lr`** if your function needs to call a function!

Data processing instructions

Table A4-2 Standard data-processing instructions

Mnemonic	Instruction	Notes
ADC	Add with Carry	-
ADD	Add	Thumb permits use of a modified immediate constant or a zero-extended 12-bit immediate constant.
ADR	Form PC-relative Address	First operand is the PC. Second operand is an immediate constant. Thumb supports a zero-extended 12-bit immediate constant. Operation is an addition or a subtraction.
AND	Bitwise AND	-
BIC	Bitwise Bit Clear	-
CMN	Compare Negative	Sets flags. Like ADD but with no destination register.
CMP	Compare	Sets flags. Like SUB but with no destination register.
EOR	Bitwise Exclusive OR	-
MOV	Copies operand to destination	Has only one operand, with the same options as the second operand in most of these instructions. If the operand is a shifted register, the instruction is an LSL, LSR, ASR, or ROR instruction instead. See <i>Shift instructions</i> on page A4-10 for details. Thumb permits use of a modified immediate constant or a zero-extended 16-bit immediate constant.

Many, Many More!

Load/Store instructions

Table A4-10 Load and store instructions

Data type	Load	Store	Load unprivileged	Store unprivileged	Load exclusive	Store exclusive
32-bit word	LDR	STR	LDRT	STRT	LDREX	STREX
16-bit halfword	-	STRH	-	STRHT	-	STREXH
16-bit unsigned halfword	LDRH	-	LDRHT	-	LDREXH	-
16-bit signed halfword	LDRSH	-	LDRSHT	-	-	-
8-bit byte	-	STRB	-	STRBT	-	STREXB
8-bit unsigned byte	LDRB	-	LDRBT	-	LDREXB	-
8-bit signed byte	LDRSB	-	LDRSBT	-	-	-
two 32-bit words	LDRD	STRD	-	-	-	-

Miscellaneous instructions

Table A4-12 Miscellaneous instructions

Instruction	See
Clear Exclusive	<i>CLREX</i> on page A6-56
Debug hint	<i>DBG</i> on page A6-67
Data Memory Barrier	<i>DMB</i> on page A6-68
Data Synchronization Barrier	<i>DSB</i> on page A6-70

Wait for Event	<i>WFE</i> on page A6-276
Wait for Interrupt	<i>WFI</i> on page A6-277
Yield	<i>YIELD</i> on page A6-278

Addressing Modes (again)

- Offset Addressing
 - Offset is added or subtracted from base register
 - Result used as effective address for memory access
 - [$\langle R_n \rangle$, $\langle \text{offset} \rangle$]
- Pre-indexed Addressing
 - Offset is applied to base register
 - Result used as effective address for memory access
 - Result written back into base register
 - [$\langle R_n \rangle$, $\langle \text{offset} \rangle$]!
- Post-indexed Addressing
 - The address from the base register is used as the EA
 - The offset is applied to the base and then written back
 - [$\langle R_n \rangle$], $\langle \text{offset} \rangle$

<offset> options

- An immediate constant
 - #10
- An index register
 - <Rm>
- A shifted index register
 - <Rm>, LSL #<shift>
- Lots of weird options...

A5.3.2 Modified immediate constants in Thumb instructions

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		
					i													imm3								a	b	c	d	e	f	g	h

Table A5-11 shows the range of modified immediate constants available in Thumb data processing instructions, and how they are encoded in the a, b, c, d, e, f, g, h, i, and imm3 fields in the instruction.

Table A5-11 Encoding of modified immediates in Thumb data-processing instructions

i:imm3:a	<const> ^a
0000x	00000000 00000000 00000000 abcdefgh
0001x	00000000 abcdefgh 00000000 abcdefgh ^b
0010x	abcdefgh 00000000 abcdefgh 00000000 ^b
0011x	abcdefgh abcdefgh abcdefgh abcdefgh ^b
01000	1bcdefgh 00000000 00000000 00000000
01001	01bcdefg h0000000 00000000 00000000
01010	001bcdef gh000000 00000000 00000000
01011	0001bcde fgh00000 00000000 00000000
.	.
.	8-bit values shifted to other positions
.	.
11101	00000000 00000000 000001bc defgh000
11110	00000000 00000000 0000001b cdefgh00
11111	00000000 00000000 00000001 bcdefgh0

- In this table, the immediate constant value is shown in binary form, to relate abcdefgh to the encoding diagram. In assembly syntax, the immediate value is specified in the usual way (a decimal number by default).
- UNPREDICTABLE if abcdefgh == 00000000.

Application Program Status Register (APSR)

APSR bit fields are in the following two categories:

- Reserved bits are allocated to system features or are available for future expansion. Further information on currently allocated reserved bits is available in *The special-purpose program status registers (xPSR)* on page B1-8. Application level software must ignore values read from reserved bits, and preserve their value on a write. The bits are defined as UNK/SBZP.
- Flags that can be set by many instructions:
 - N, bit [31] Negative condition code flag. Set to bit [31] of the result of the instruction. If the result is regarded as a two's complement signed integer, then $N = 1$ if the result is negative and $N = 0$ if it is positive or zero.
 - Z, bit [30] Zero condition code flag. Set to 1 if the result of the instruction is zero, and to 0 otherwise. A result of zero often indicates an equal result from a comparison.
 - C, bit [29] Carry condition code flag. Set to 1 if the instruction results in a carry condition, for example an unsigned overflow on an addition.
 - V, bit [28] Overflow condition code flag. Set to 1 if the instruction results in an overflow condition, for example a signed overflow on an addition.
 - Q, bit [27] Set to 1 if an SSAT or USAT instruction changes (saturates) the input value for the signed or unsigned range of the result.

Updating the APSR

- SUB Rx, Ry
 - $Rx = Rx - Ry$
 - APSR unchanged
- SUBS
 - $Rx = Rx - Ry$
 - APSR N, Z, C, V updated
- ADD Rx, Ry
 - $Rx = Rx + Ry$
 - APSR unchanged
- ADDS
 - $Rx = Rx + Ry$
 - APSR N, Z, C, V updated

Overflow and carry in APSR

```
unsigned_sum = UInt(x) + UInt(y) + UInt(carry_in);
```

```
signed_sum = SInt(x) + SInt(y) + UInt(carry_in);
```

```
result = unsigned_sum<N-1:0>; // == signed_sum<N-1:0>
```

```
carry_out = if UInt(result) == unsigned_sum then '0' else '1';
```

```
overflow = if SInt(result) == signed_sum then '0' else '1';
```

Conditional execution:

Append to many instructions for conditional execution

Table A6-1 Condition codes

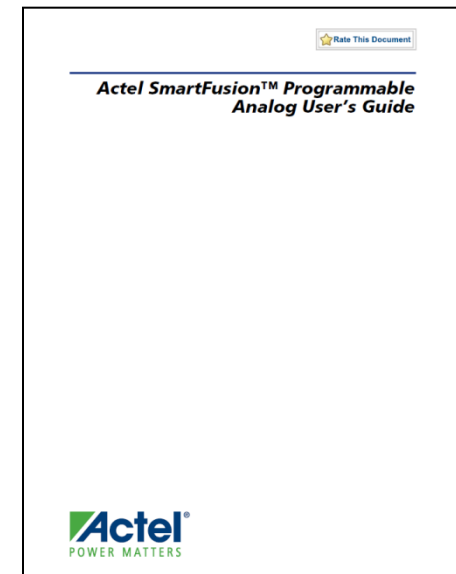

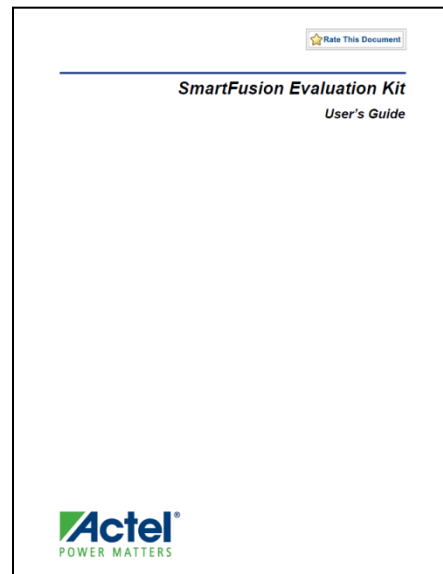

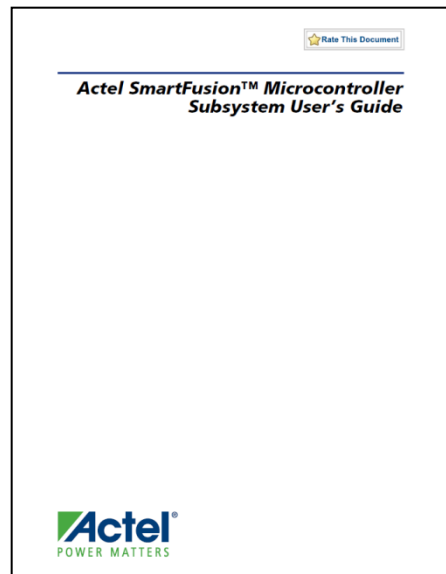

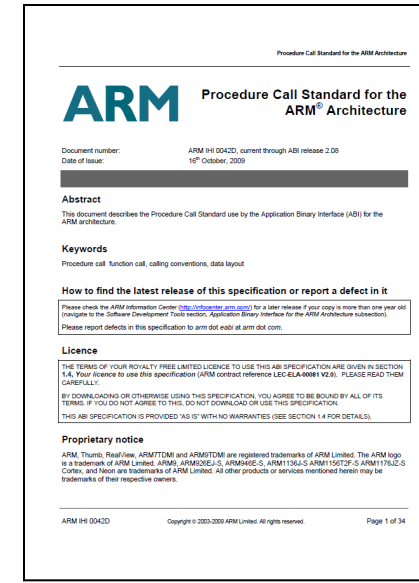

cond	Mnemonic extension	Meaning (integer)	Meaning (floating-point) ^{ab}	Condition flags
0000	EQ	Equal	Equal	$Z = 1$
0001	NE	Not equal	Not equal, or unordered	$Z = 0$
0010	CS ^c	Carry set	Greater than, equal, or unordered	$C = 1$
0011	CC ^d	Carry clear	Less than	$C = 0$
0100	MI	Minus, negative	Less than	$N = 1$
0101	PL	Plus, positive or zero	Greater than, equal, or unordered	$N = 0$
0110	VS	Overflow	Unordered	$V = 1$
0111	VC	No overflow	Not unordered	$V = 0$
1000	HI	Unsigned higher	Greater than, or unordered	$C = 1$ and $Z = 0$
1001	LS	Unsigned lower or same	Less than or equal	$C = 0$ or $Z = 1$
1010	GE	Signed greater than or equal	Greater than or equal	$N = V$
1011	LT	Signed less than	Less than, or unordered	$N \neq V$
1100	GT	Signed greater than	Greater than	$Z = 0$ and $N = V$
1101	LE	Signed less than or equal	Less than, equal, or unordered	$Z = 1$ or $N \neq V$
1110	None (AL) ^e	Always (unconditional)	Always (unconditional)	Any

IT blocks

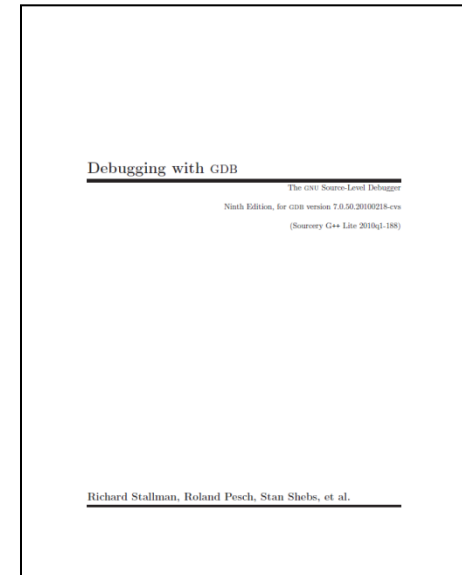

- Conditional execution in C-M3 done in “IT” block
- IT [T|E]*3
- More on this later...

The ARM architecture “books” for this class

The ARM software tools “books” for this class

Exercise:
What is the value of r2 at done?

...

start:

movs r0, #1

movs r1, #1

movs r2, #1

sub r0, r1

bne done

movs r2, #2

done:

b done

...

Solution:
What is the value of r2 at done?

...

start:

```
    movs    r0, #1        // r0 ← 1, Z=0
    movs    r1, #1        // r1 ← 1, Z=0
    movs    r2, #1        // r2 ← 1, Z=0
    sub     r0, r1         // r0 ← r0-r1
                        // but Z flag untouched
                        // since sub vs subs_
    bne     done           // NE true when Z==0
                        // So, take the branch
    movs    r2, #2        // not executed
```

done:

```
    b       done           // r2 is still 1
```

Walk through of the ARM ISA

Software Development Tool Flow

Application Binary Interface (ABI)

How does an assembly language program get turned into a executable program image?

What are the real GNU executable names for the ARM?

- Just add the prefix “arm-none-eabi-” prefix
- Assembler (as)
 - arm-none-eabi-as
- Linker (ld)
 - arm-none-eabi-ld
- Object copy (objcopy)
 - arm-none-eabi-objcopy
- Object dump (objdump)
 - arm-none-eabi-objdump
- C Compiler (gcc)
 - arm-none-eabi-gcc
- C++ Compiler (g++)
 - arm-none-eabi-g++

How are assembly files assembled?

- `$ arm-none-eabi-as`
 - Useful options
 - `-mcpu`
 - `-mthumb`
 - `-O`

```
$ arm-none-eabi-as -mcpu=cortex-m3 -mthumb example1.s -o example1.o
```

A “real” ARM assembly language program for GNU

```
        .equ    STACK_TOP, 0x20000800
        .text
        .syntax unified
        .thumb
        .global _start
        .type   start, %function

_start:
        .word   STACK_TOP, start
start:
        movs    r0, #10
        movs    r1, #0
loop:
        adds    r1, r0
        subs    r0, #1
        bne     loop
deadloop:
        b       deadloop
        .end
```

What's it all mean?

```
.equ    STACK_TOP, 0x20000800    /* Equates symbol to value */
.text                                     /* Tells AS to assemble region */
.syntax unified                       /* Means language is ARM UAL */
.thumb                                /* Means ARM ISA is Thumb */
.global _start                       /* .global exposes symbol */
                                         /* _start label is the beginning */
                                         /* ...of the program region */
.type   start, %function             /* Specifies start is a function */
                                         /* start label is reset handler */

_start:
    .word    STACK_TOP, start        /* Inserts word 0x20000800 */
                                         /* Inserts word (start) */

start:
    movs r0, #10                     /* We've seen the rest ... */
    movs r1, #0

loop:
    adds r1, r0
    subs r0, #1
    bne  loop

deadloop:
    b    deadloop
    .end
```

A simple (hardcoded) Makefile example

```
all:
    arm-none-eabi-as -mcpu=cortex-m3 -mthumb example1.s -o example1.o
    arm-none-eabi-ld -Ttext 0x0 -o example1.out example1.o
    arm-none-eabi-objcopy -Obinary example1.out example1.bin
    arm-none-eabi-objdump -S example1.out > example1.lst
```

What information does the disassembled file provide?

all:

```
arm-none-eabi-as -mcpu=cortex-m3 -mthumb example1.s -o example1.o
arm-none-eabi-ld -Ttext 0x0 -o example1.out example1.o
arm-none-eabi-objcopy -Obinary example1.out example1.bin
arm-none-eabi-objdump -S example1.out > example1.lst
```

```
.equ      STACK_TOP, 0x20000800
.text
.syntax   unified
.thumb
.global   _start
.type     start, %function

_start:
.word     STACK_TOP, start

start:
    movs r0, #10
    movs r1, #0

loop:
    adds r1, r0
    subs r0, #1
    bne  loop

deadloop:
    b    deadloop
.end
```

example1.out: file format elf32-littlearm

Disassembly of section .text:

```
00000000 <_start>:
    0:      20000800    .word     0x20000800
    4:      00000009    .word     0x00000009

00000008 <start>:
    8:      200a      movs     r0, #10
    a:      2100      movs     r1, #0

0000000c <loop>:
    c:      1809      adds     r1, r1, r0
    e:      3801      subs     r0, #1
    10:     d1fc      bne.n    c <loop>

00000012 <deadloop>:
    12:     e7fe      b.n      12 <deadloop>
```

How does a mixed C/Assembly program get turned into a executable program image?

Application Binary Interface (ABI)

Register	Synonym	Special	Role in the procedure call standard
r15		PC	The Program Counter.
r14		LR	The Link Register.
r13		SP	The Stack Pointer.
r12		IP	The Intra-Procedure-call scratch register.
r11	v8		Variable-register 8.
r10	v7		Variable-register 7.
r9		v6 SB TR	Platform register. The meaning of this register is defined by the platform standard.
r8	v5		Variable-register 5.
r7	v4		Variable register 4.
r6	v3		Variable register 3.
r5	v2		Variable register 2.
r4	v1		Variable register 1.
r3	a4		Argument / scratch register 4.
r2	a3		Argument / scratch register 3.
r1	a2		Argument / result / scratch register 2.
r0	a1		Argument / result / scratch register 1.

TABLE 2.1: The Procedure Call Standard Registers

ABI quote

- A subroutine must preserve the contents of the registers r4-r8, r10, r11 and SP (and r9 in PCS variants that designate r9 as v6).
