## LR Parsing

### Bottom-Up Parsing

#1

---

---

---

---

---

---

---

---

## Outline

- No Stopping The Parsing!
- Bottom-Up Parsing
- LR Parsing
  - Shift and Reduce
  - LR(1) Parsing Algorithm
- LR(1) Parsing Tables

#2

---

---

---

---

---

---

---

---

## In One Slide

- An **LR(1) parser** reads tokens from **left to right** and constructs a **bottom-up rightmost** derivation. LR(1) parsers **shift** terminals and **reduce** the input by application productions in **reverse**. LR(1) parsing is **fast and easy**, and uses a finite automaton **with a stack**. LR(1) works fine if the grammar is **left-recursive**, or **not left-factored**.

#3

---

---

---

---

---

---

---

---

## Bottom-Up Parsing

- **Bottom-up parsing** is more general than top-down parsing
  - And just as efficient
  - Builds on ideas in top-down parsing
  - Preferred method in practice
- Also called **LR parsing**
  - L means that tokens are read **left to right**
  - R means that it constructs a **rightmost derivation**

#4

---

---

---

---

---

---

---

---

## An Introductory Example

- LR parsers don't need left-factored grammars and can also handle left-recursive grammars
- Consider the following grammar:
$$E \rightarrow E + ( E ) \mid \text{int}$$
  - Why is this **not** LL(1)? (Guess before I show you!)
- Consider the string: **int + ( int ) + ( int )**

#5

---

---

---

---

---

---

---

---

## The Idea

- LR parsing **reduces** a string to the start symbol by **inverting** productions:

**str** ← input string of terminals

repeat

- Identify  **$\beta$**  in **str** such that  $A \rightarrow \beta$  is a production (i.e.,  $\text{str} = \alpha \beta \gamma$ )
- Replace  **$\beta$**  by **A** in **str** (i.e., **str** becomes  $\alpha A \gamma$ )

until **str** = **S**

#6

---

---

---

---

---

---

---

---

## A Bottom-up Parse in Detail (1)

int + (int) + (int)

int + ( int ) + ( int )

47

---

---

---

---

---

---

---

---

## A Bottom-up Parse in Detail (2)

int + (int) + (int)  
E + (int) + (int)

E  
|  
int + ( int ) + ( int )

48

---

---

---

---

---

---

---

---

## A Bottom-up Parse in Detail (3)

int + (int) + (int)  
E + (int) + (int)  
E + (E) + (int)

E            E  
|            |  
int + ( int ) + ( int )

49

---

---

---

---

---

---

---

---

### A Bottom-up Parse in Detail (4)

int + (int) + (int)  
 E + (int) + (int)  
**E + (E) + (int)**  
 E + (int)

#10

---

---

---

---

---

---

---

---

### A Bottom-up Parse in Detail (5)

int + (int) + (int)  
 E + (int) + (int)  
 E + (E) + (int)  
**E + (int)**  
 E + (E)

#11

---

---

---

---

### A Bottom-up Parse in Detail (6)

int + (int) + (int)  
 E + (int) + (int)  
 E + (E) + (int)  
 E + (int)  
**E + (E)**  
 E

A rightmost derivation  
 in reverse

#12

---

---

---

---

---

---

---

---

## Important Fact

Important Fact #1 about bottom-up parsing:

*An LR parser traces a rightmost derivation in reverse.*

#13

---

---

---

---

---

---

---

---

## Where Do Reductions Happen

Important Fact #1 has an interesting consequence:

- Let  $\alpha\beta\gamma$  be a step of a bottom-up parse
- Assume the next reduction is by  $A \rightarrow \beta$
- Then  $\gamma$  is a string of **terminals!**

Why? Because  $\alpha A \gamma \rightarrow \alpha\beta\gamma$  is a step in a rightmost derivation

#14

---

---

---

---

---

---

---

---

## Notation

- Idea: Split the string into two substrings
  - **Right substring** (a string of terminals) is as yet unexamined by parser
  - **Left substring** has terminals and non-terminals
- The dividing point is marked by a  $\blacktriangleright$ 
  - The  $\blacktriangleright$  is not part of the string
- Initially, all input is new:  $\blacktriangleright X_1 X_2 \dots X_n$

#15

---

---

---

---

---

---

---

---

## Shift-Reduce Parsing

- Bottom-up parsing uses only two kinds of actions:

*Shift*

*Reduce*

#16

---

---

---

---

---

---

---

---

## Shift

- Shift*: Move ► one place to the right
- Shifts a terminal to the left string

$$\begin{aligned} E + (\color{red}{\blacktriangleright} \text{int } ) \\ \Rightarrow \\ E + (\text{int } \color{red}{\blacktriangleright} ) \end{aligned}$$

#17

---

---

---

---

---

---

---

---

## Reduce

- Reduce*: Apply an *inverse* production at the *right end* of the left string
- If  $T \rightarrow E + ( E )$  is a production, then

$$\begin{aligned} E + ( \underline{E + ( E )} \color{red}{\blacktriangleright} ) \\ \Rightarrow \\ E + ( \underline{T} \color{red}{\blacktriangleright} ) \end{aligned}$$

Reductions can only happen here!

#18

---

---

---

---

---

---

---

---

## Shift-Reduce Example

► `int + (int) + (int)$` shift

`int + ( int )+ ( int )`  
↑

#19

---

---

---

---

---

---

---

---

## Shift-Reduce Example

► `int + (int) + (int)$` shift

`int` ► `int + (int) + (int)$` red. `E → int`

`int + ( int )+ ( int )`  
↑

#20

---

---

---

---

---

---

---

---

## Shift-Reduce Example

► `int + (int) + (int)$` shift

`int` ► `int + (int) + (int)$` red. `E → int`

`E` ► `int + (int) + (int)$` shift 3 times

`E`  
/  
`int + ( int )+ ( int )`  
↑

#21

---

---

---

---

---

---

---

---

## Shift-Reduce Example

► int + (int) + (int)\$ shift  
int ► + (int) + (int)\$ red. E → int  
E ► + (int) + (int)\$ shift 3 times  
E + (int ►) + (int)\$ red. E → int

E  
/  
int + ( int ) + ( int )  
↑

#22

---

---

---

---

---

---

---

---

## Shift-Reduce Example

► int + (int) + (int)\$ shift  
int ► + (int) + (int)\$ red. E → int  
E ► + (int) + (int)\$ shift 3 times  
E + (int ►) + (int)\$ red. E → int  
E + (E ►) + (int)\$ shift

E E  
/ /  
int + ( int ) + ( int )  
↑

#23

---

---

---

---

---

---

---

---

## Shift-Reduce Example

► int + (int) + (int)\$ shift  
int ► + (int) + (int)\$ red. E → int  
E ► + (int) + (int)\$ shift 3 times  
E + (int ►) + (int)\$ red. E → int  
E + (E ►) + (int)\$ shift  
E + (E) ► + (int)\$ red. E → E + (E)

E E  
/ /  
int + ( int ) + ( int )  
↑

#24

---

---

---

---

---

---

---

---

## Shift-Reduce Example

▶ int + (int) + (int)\$ shift  
 int ▶ + (int) + (int)\$ red. E → int  
 E ▶ + (int) + (int)\$ shift 3 times  
 E + (int ▶) + (int)\$ red. E → int  
 E + (E ▶) + (int)\$ shift  
 E + (E) ▶ + (int)\$ red. E → E + (E)  
 E ▶ + (int)\$ shift 3 times

#25

---

---

---

---

---

---

---

---

## Shift-Reduce Example

▶ int + (int) + (int)\$ shift  
 int ▶ + (int) + (int)\$ red. E → int  
 E ▶ + (int) + (int)\$ shift 3 times  
 E + (int ▶) + (int)\$ red. E → int  
 E + (E ▶) + (int)\$ shift  
 E + (E) ▶ + (int)\$ red. E → E + (E)  
 E ▶ + (int)\$ shift 3 times  
 E + (int ▶)\$ red. E → int

#26

---

---

---

---

---

---

---

---

## Shift-Reduce Example

▶ int + (int) + (int)\$ shift  
 int ▶ + (int) + (int)\$ red. E → int  
 E ▶ + (int) + (int)\$ shift 3 times  
 E + (int ▶) + (int)\$ red. E → int  
 E + (E ▶) + (int)\$ shift  
 E + (E) ▶ + (int)\$ red. E → E + (E)  
 E ▶ + (int)\$ shift 3 times  
 E + (int ▶)\$ red. E → int  
 E + (E ▶)\$ shift

#27

---

---

---

---

---

---

---

---

## Shift-Reduce Example

▶ int + (int) + (int)\$ shift  
 int ▶ + (int) + (int)\$ red. E → int  
 E ▶ + (int) + (int)\$ shift 3 times  
 E + (int ▶ ) + (int)\$ red. E → int  
 E + (E ▶ ) + (int)\$ shift  
 E + (E) ▶ + (int)\$ red. E → E + (E)  
 E ▶ + (int)\$ shift 3 times  
 E + (int ▶ )\$ red. E → int  
 E + (E ▶ )\$ shift  
 E + (E) ▶ \$ red. E → E + (E)

#28

---

---

---

---

---

---

---

---

## Shift-Reduce Example

▶ int + (int) + (int)\$ shift  
 int ▶ + (int) + (int)\$ red. E → int  
 E ▶ + (int) + (int)\$ shift 3 times  
 E + (int ▶ ) + (int)\$ red. E → int  
 E + (E ▶ ) + (int)\$ shift  
 E + (E) ▶ + (int)\$ red. E → E + (E)  
 E ▶ + (int)\$ shift 3 times  
 E + (int ▶ )\$ red. E → int  
 E + (E ▶ )\$ shift  
 E + (E) ▶ \$ red. E → E + (E)  
 E ▶ \$ accept

#29

---

---

---

---

---

---

---

---

## The Stack

- Left string can be implemented as a **stack**
  - Top of the stack is the ▶
- Shift pushes a **terminal** on the stack
- Reduce pops 0 or more **symbols** from the stack (production RHS) and pushes a **non-terminal** on the stack (production LHS)

#30

---

---

---

---

---

---

---

---

## Key Issue: When to Shift or Reduce?

- Decide based on the **left string (the stack)**
- Idea: use a **finite automaton (DFA)** to decide when to shift or reduce
  - The **DFA input is the stack**
  - DFA language consists of terminals and nonterminals
- We run the DFA on the stack and we examine the resulting state  $X$  and the token  $tok$  after  $\blacktriangleright$ 
  - If  $X$  has a transition labeled  $tok$  then **shift**
  - If  $X$  is labeled with " $A \rightarrow \beta$  on  $tok$ " then **reduce**

#31

---

---

---

---

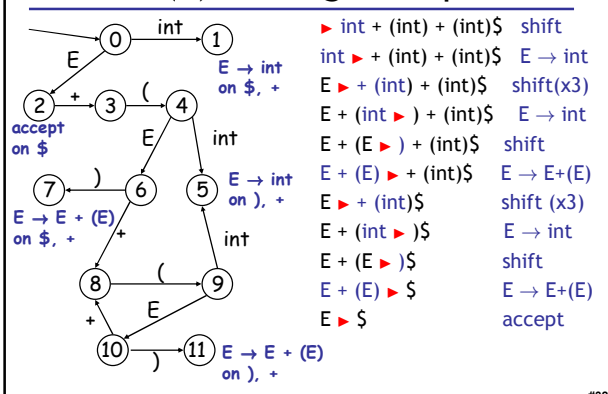

---

---

---

---

## LR(1) Parsing Example

#32

---

---

---

---

---

---

---

---

## Representing the DFA

- Parsers represent the DFA as a 2D table
  - Recall table-driven lexical analysis
- Lines (rows) correspond to DFA states
- Columns correspond to terminals and non-terminals
- Typically columns are split into:
  - Those for terminals: **action table**
  - Those for non-terminals: **goto table**

#33

---

---

---

---

---

---

---

---

## Representing the DFA. Example

- The table for a fragment of our DFA:

	int	+	(	)	\$	E
...						
3			s4			
4	s5					g6
5	r <sub>E→int</sub>					r <sub>E→int</sub>
6	s8			s7		
7	r <sub>E→E+(E)</sub>					r <sub>E→E+(E)</sub>
...						

*E → E + (E) on \$, +*

*E → int on ), +*

#34

---

---

---

---

---

---

---

---

---

---

## The LR Parsing Algorithm

- After a shift or reduce action we rerun the DFA on the entire stack
  - This is wasteful, since most of the work is repeated
- Optimization:** remember for each stack element to which state it brings the DFA
- LR parser maintains a stack
  - $\langle \text{sym}_1, \text{state}_1 \rangle \dots \langle \text{sym}_n, \text{state}_n \rangle$
  - $\text{state}_k$  is the final state of the DFA on  $\text{sym}_1 \dots \text{sym}_k$

---

---

---

---

---

---

---

---

---

---

## The LR Parsing Algorithm

Let  $S = w\$$  be initial input  
 Let  $j = 0$   
 Let DFA state 0 be the start state  
 Let stack =  $\langle \text{dummy}, 0 \rangle$

**repeat**

**match**  $\text{action}[\text{top\_state}(\text{stack}), S[j]]$  **with**

- | **shift**  $k$ : push  $\langle S[j++], k \rangle$
- | **reduce**  $X \rightarrow \alpha$ :
  - pop  $|\alpha|$  pairs,
  - push  $\langle X, \text{Goto}[\text{top\_state}(\text{stack}), X] \rangle$
- | **accept**: halt normally
- | **error**: halt and report error

---

---

---

---

---

---

---

---

---

---

## LR Parsing Notes

- Can be used to parse **more grammars than LL**
- Most PL grammars are LR
- Can be described as a **simple table**
- There are tools for building the table
  - Often called “yacc” or “bison”
- How is the table constructed? Next time!

#37

---

---

---

---

---

---

---

---

## Homework

- Thursday: WA2 due
  - You may work in pairs.
- Thursday: Read 2.3.4-2.3.5, 2.4.2-2.4.3
- Next Friday: WA3 due
  - Parsing!
