

# Intro To Parsing

#### **Step By Step**

#### Reading Quiz Answers

- Avg Class Grade: 1.24 / 3.0 = 41%
  - "I can't honestly remember even hearing about this reading."
  - "I bow my head in shame and will catch up with reading asap."
- Are practical parsers and scanners based on deterministic or non-deterministic automata?
  - Deterministic
  - Half credit: "they are equivalent" w/o "convert to DFA"
- How can regular expressions be used to specify nested constructs?
  - They cannot. (Scott Book 2.1.2, second sentence)
  - Nested parentheses (n) are the canonical example.
- How is a two-dimensional transition table used in tabledriven scanning?
  - new\_state = table[old\_state][new\_character]

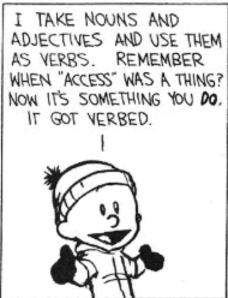

#### New Reading Quiz

- What does "recursive descent" mean?
- What is a "nonterminal" in a CFG?
- Draw a parse tree for  $E \rightarrow 1 + (1 + 1)$  given:

 $E \rightarrow 1$   $E \rightarrow E + E$   $E \rightarrow (E)$ 

 Extra Credit: Name a "truth that might hurt" or a "peril of JavaSchools".

#### Cunning Plan

- Formal Languages
  - Regular Languages Revisited
- Parser Overview
- Context-Free Grammars (CFGs)
- Derivations
- Ambiguity

#### One-Slide Summary

- A parser takes a sequence of tokens as input. If the input is valid, it produces a parse tree (or derivation).
- Context-free grammars are a notation for specifying formal languages. They contain *terminals*, *non-terminals* and *productions* (aka *rewrite rules*).

#### Languages and Automata

- Formal languages are very important in CS
  - Especially in programming languages

- Regular languages
  - The weakest formal languages widely used
  - Many applications

- We will also study context-free languages
  - A "stronger" type of formal language

### Limitations of Regular Languages

- Intuition: A finite automaton that runs long enough must repeat states
  - Pigeonhole Principle: imagine 20 states and 300 input characters
- A finite automaton can't remember how often it has visited a particular state
  - Only enough to store in which state it is in
  - Cannot count, except up to a finite limit
- Language of balanced parentheses is not regular: { (i )i | i ≥ 0}

### The Functionality of the Parser

- Input: sequence of tokens from lexer
  - e.g., the .cl-lex files you make in PA2

- Output: parse tree of the program
  - Also called an *abstract syntax tree*
- Output: error if the input is not valid
  - e.g., "parse error on line 3"

#### Example

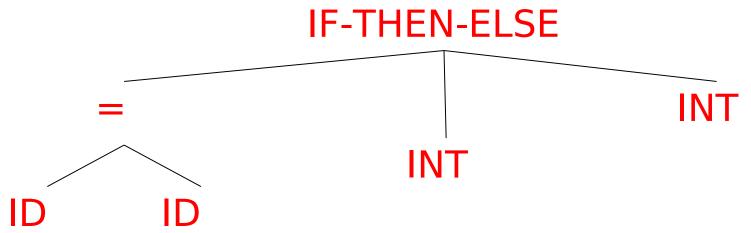

Cool program text

if 
$$x = y$$
 then 1 else 2 fi

Parser input (tokens)

$$IF ID = ID THEN INT ELSE INT FI$$

Parser output (tree)

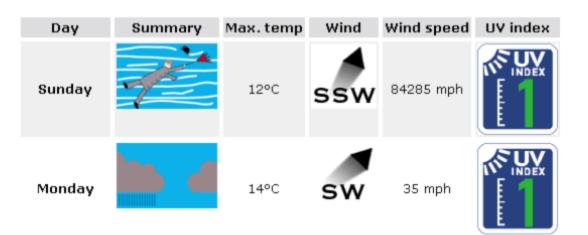

#### Comparison: Lexical Analysis

Phase	Input	Output
Lexer	Sequence of characters	Sequence of tokens
Parser	Sequence of tokens	Parse tree

#### Weather: Five Day Forecast

Plan your week with this forecast from the Jersey Meteorological Department. See also: • Today's Weather • UV Index

#### The Role of the Parser

- Not all sequences of tokens are programs then x \* / + 3 while x ; y z then
- The parser must distinguish between valid and invalid sequences of tokens

- We need
  - A language to describe valid sequences of tokens
  - A method (an algorithm) for distinguishing valid from invalid sequences of tokens

### Programming Language Structure

- Programming languages have recursive structure
- Consider the language of arithmetic expressions with integers, +, \*, and ( )
- An expression is either:
  - an integer
  - an expression followed by "+" followed by expression
  - an expression followed by "\*" followed by expression
  - a '(' followed by an expression followed by ')'
- int , int + int , (int + int) \* int are expressions

## Notation for Programming Languages

An alternative notation:

$$E \rightarrow int$$
 $E \rightarrow E + E$ 
 $E \rightarrow E * E$ 
 $E \rightarrow (E)$ 

- We can view these rules as rewrite rules
  - We start with E and replace occurrences of E with some right-hand side

• 
$$E \rightarrow E * E \rightarrow (E) * E \rightarrow (E + E) * E$$

$$\rightarrow ... \rightarrow (int + int) * int$$

#### Observation

- All arithmetic expressions can be obtained by a sequence of replacements
- Any sequence of replacements forms a valid arithmetic expression
- This means that we cannot obtain

```
(int))
```

by any sequence of replacements. Why?

This notation is a context-free grammar

#### Context Free Grammars

- A **context-free grammar** consists of
  - A set of *non-terminals N* 
    - Written in uppercase in these notes
  - A set of *terminals T* 
    - Lowercase or punctuation in these notes
  - A **start symbol 5** (a non-terminal)
  - A set of *productions* (rewrite rules)
- Assuming E ∈ N

$$E \to \epsilon$$
 , or 
$$E \to Y_1 \; Y_2 \; ... \; Y_n \qquad \qquad \text{where} \quad Y_i \subseteq N \cup T$$

#### Examples of CFGs

Simple arithmetic expressions:

```
E \rightarrow int
E \rightarrow E + E
E \rightarrow E * E
E \rightarrow (E)
```

- One non-terminal: E
- Several terminals: int + \* ()
  - Called terminals because they are never replaced
- By convention the non-terminal for the first production is the start symbol

### The Language of a CFG

Read productions as replacement rules:

$$X \rightarrow Y_1 \dots Y_n$$

Means X can be replaced by  $Y_1 \dots Y_n$ 

$$X \rightarrow \epsilon$$

Means X can be erased or "eaten" (replaced with empty string)

#### Key Idea

To construct a valid sequence of terminals:

- Begin with a string consisting of the start symbol "S"
- Replace any <u>non-terminal</u> X in the string by a right-hand side of some production

$$X \rightarrow Y_1 \dots Y_n$$

 Continue replacing until there are only terminals in the string

#### The Language of a CFG: →

More formally, write

$$X_{1} \dots X_{i-1} X_{i} X_{i+1} \dots X_{n}$$

$$\rightarrow$$

$$X_{1} \dots X_{i-1} Y_{1} \dots Y_{m} X_{i+1} \dots X_{n}$$

if there is a production

$$X_i \rightarrow Y_1 \dots Y_m$$

### The Language of a CFG: $\rightarrow$ \*

Write

$$X_1 \dots X_n \rightarrow^* Y_1 \dots Y_m$$

if

$$X_1 \dots X_n \rightarrow \dots \rightarrow Y_1 \dots Y_m$$

in 0 or more steps.

### The Language of a CFG

Let G be a context-free grammar with start symbol S. Then the <u>language of</u> G is:

L(G) = { 
$$a_1 ... a_n | S \rightarrow^* a_1 ... a_n and$$
  
every  $a_i$  is a terminal }

L(G) is a set of strings over the alphabet of terminals.

### CFG Language Examples

```
S \rightarrow 0 also written as S \rightarrow 0 1
S \rightarrow 1
            Generates the language { "0", "1" }
• What about S \rightarrow 1 A
                     A \rightarrow 0 \mid 1
                                                Paper time!
• What about S \rightarrow 1 A
                     A \rightarrow 0 \mid 1 A
```

• What about  $S \rightarrow \varepsilon \mid (S)$ 

#### Arithmetic Example

Simple arithmetic expressions:

$$E \rightarrow E+E \mid E*E \mid (E) \mid id$$

Some elements of the language:

#### Cool Example

A fragment of COOL:

```
EXPR → if EXPR then EXPR else EXPR fi
| while EXPR loop EXPR pool
| id
```

### Cool Example (Cont.)

Some elements of the language

id if id then id

if id then id else id fi

while id loop id pool

if while id loop id pool then id else id if if id then id else id fi

#### Notes

The idea of a CFG is a big step. But:

- Membership in a language is "yes" or "no"
  - we also need *parse tree* of the input

We must handle errors gracefully

- Need an implementation of CFGs
  - bison, yacc, ocamlyacc, ply, etc.

#### More Notes

- Form of the grammar is important
  - Many grammars generate the same language
    - Give me an example.
  - Automatic tools are sensitive to the grammar

 Note: Tools for regular languages (e.g., flex) are also sensitive to the form of the regular expression, but this is rarely a problem in practice

#### Derivations and Parse Trees

A <u>derivation</u> is a sequence of productions

$$\mathsf{S} \to ... \to ...$$

#### A derivation can be drawn as a tree

- Start symbol is the tree's root
- For a production  $X \to Y_1 \dots Y_n$  add children  $Y_1$ , ...,  $Y_n$  to node X

### Derivation Example

• Grammar  $E \rightarrow E+E \mid E*E \mid (E) \mid id$ 

• String id \* id + id

We're going to build a derivation!

### Derivation Example (Cont.)

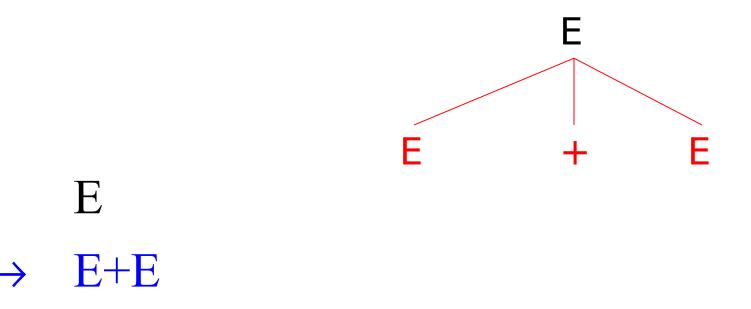

```
E
      E+E
\rightarrow E*E+E
                                 Thus E \rightarrow^* id * id + id
\rightarrow id * E + E
\rightarrow id*id+E
\rightarrow id * id + id
```

### Derivation in Detail (1)

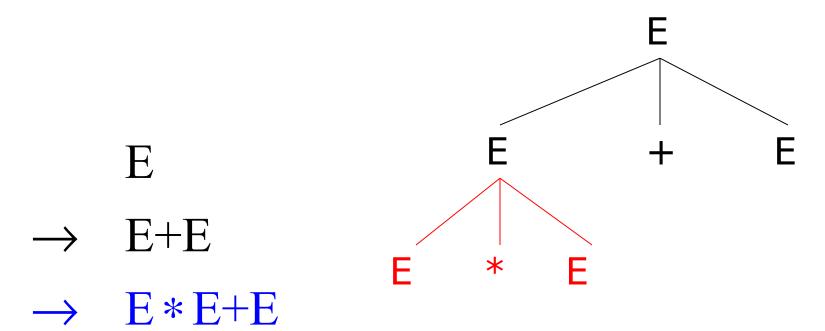

Е

E

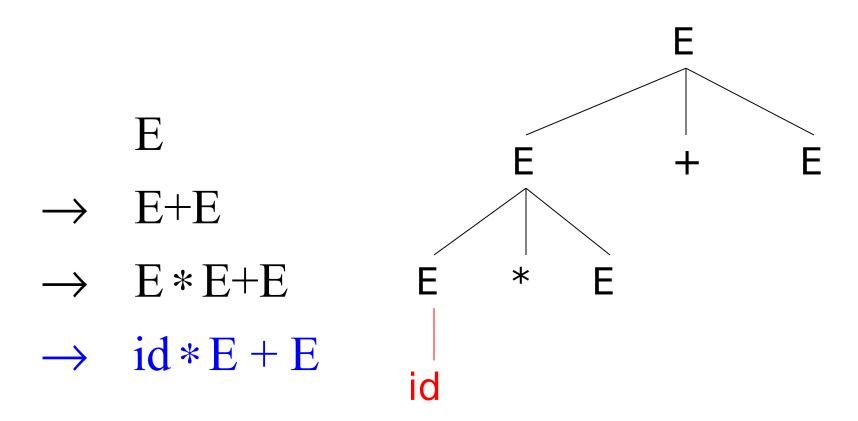

### Derivation in Detail (2)

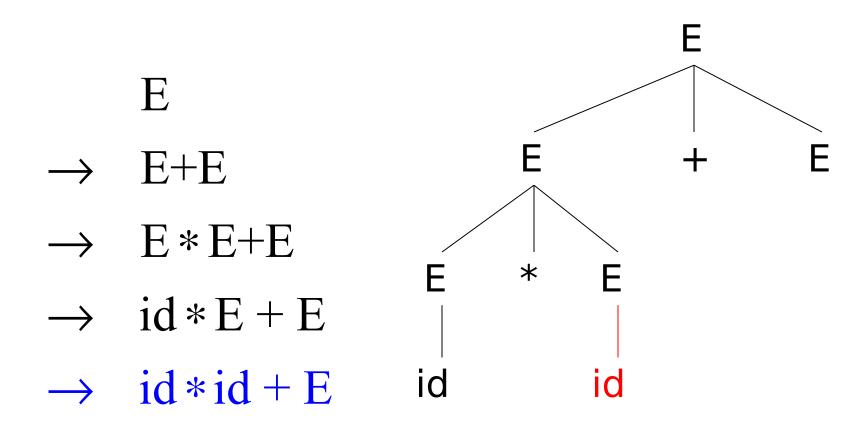

#### Derivation in Detail (3)

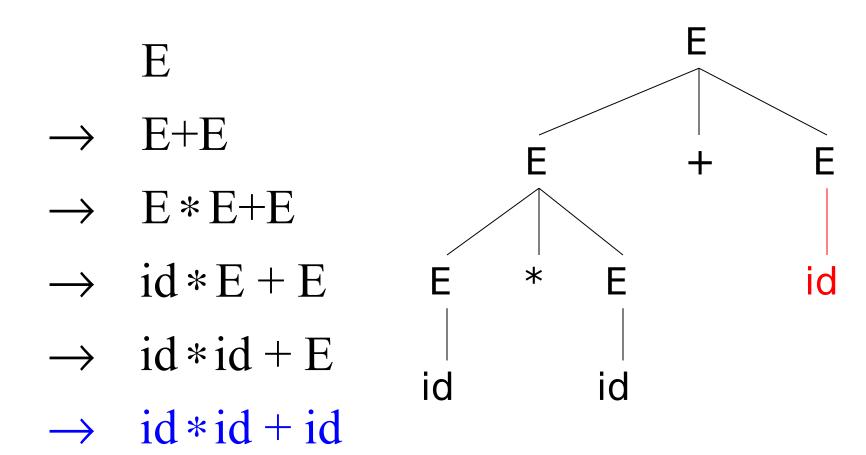

### Derivation in Detail (4)

#### Derivation in Detail (5)

#### Derivation in Detail (6)

#### Notes on Derivations

- A parse tree has
  - Terminals at the leaves
  - Non-terminals at the interior nodes

A left-right traversal of the leaves is the original input

 The parse tree shows the association of operations, the input string does not!

### Q: Radio (117 / 842)

 This NPR radio show features Tom and Ray Magliozzi as Click and Clack the Tappet Brothers. It includes Boston accents, a weekly "Puzzler", and is brought to you in part by "Paul Murky of Murky Research" and the law firm of "Dewey, Cheetham and Howe".

Q: Games (548 / 842)

 In the card game Hearts, how many points would you accumulate if you ended up with all of the Queens and all of the Jacks?

Q: Music (158 / 842)

 Name the "shocking" 1976 line dance created by Ric Silver and sung and choreographed by Marcia Griffiths.

#### Q: Games (582 / 842)

 Minty, Snuzzle, Butterscotch, Bluebelle, Cotton Candy, and Blossom were the first six characters in the 1982 edition of this series of Hasbro-produced brushable hoofed dolls with designs on their hips.

### Left-most and Right-most Derivations

- The example before was a left-most derivation
  - At each step, we replaced the left-most non-terminal
- There is an equivalent notion of a right-most derivation
  - Shown on this slide ...
  - ... and the next!

$$\rightarrow$$
 E+E

$$\rightarrow$$
 E+id

$$\rightarrow$$
 E \* E + id

$$\rightarrow$$
 E \* id + id

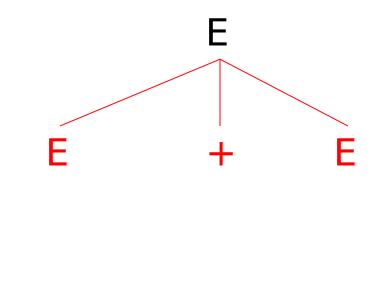

$$\rightarrow$$
 id \* id + id

# Right-most Derivation in Detail (2)

# Right-most Derivation in Detail (3)

 $E \\ \rightarrow E + E \\ \rightarrow E + id$ 

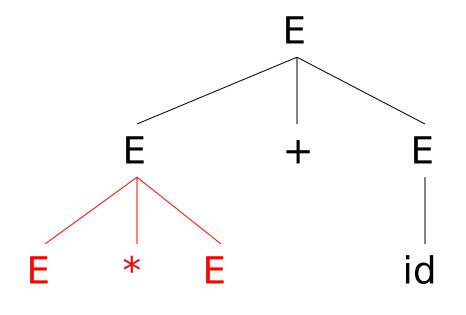

# Right-most Derivation in Detail (4)

$$E$$

$$\rightarrow E+E$$

$$\rightarrow E+id$$

# Right-most Derivation in Detail (5)

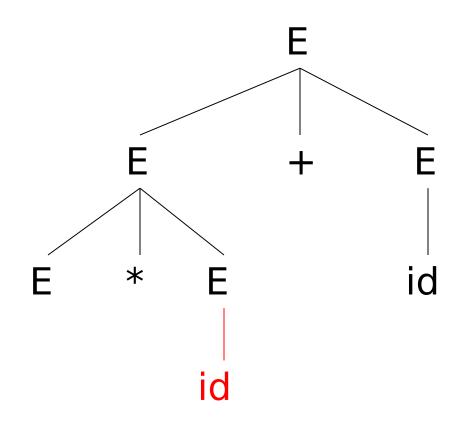

$$E$$

$$\rightarrow E+E$$

$$\rightarrow E+id$$

$$\rightarrow E*E+id$$

$$\rightarrow E*id+id$$

# Right-most Derivation in Detail (6)

$$E$$

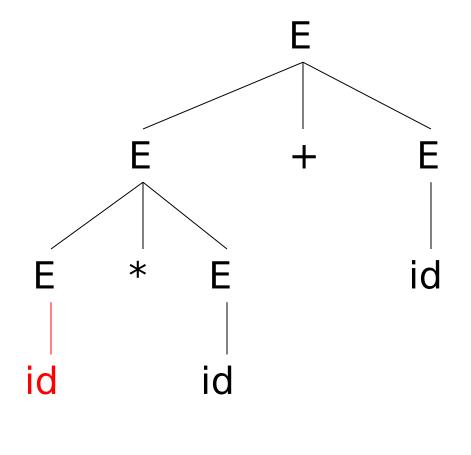

$$\rightarrow E+E$$

$$\rightarrow E+id$$

$$\rightarrow E*E+id$$

$$\rightarrow E*id+id$$

$$\rightarrow id*id+id$$

#### Derivations and Parse Trees

 Note that for each parse tree there is a left-most and a right-most derivation

 The difference is the order in which branches are added

- We will start with a parsing technique that yields left-most derivations
  - Later we'll move on to right-most derivations

#### Summary of Derivations

We are not just interested in whether

$$s \in L(G)$$

- We also need a parse tree for s

- A derivation defines a parse tree
  - But one parse tree may have many derivations

 Left-most and right-most derivations are important in parser implementation

#### Review

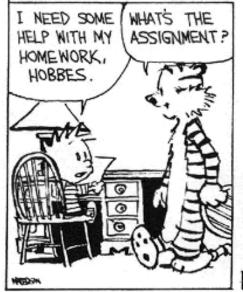

- A parser consumes a sequence of tokens s and produces a parse tree
- Issues:
  - How do we recognize that  $s \in L(G)$ ?
  - A parse tree of s describes <u>how</u> s ∈ L(G)
  - Ambiguity: more than one parse tree (interpretation) for some string s
  - Error: no parse tree for some string s
  - How do we construct the parse tree?

### **Ambiguity**

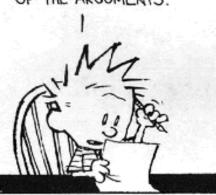

• (Ambiguous) Grammar G

$$E \rightarrow E + E \mid E * E \mid (E) \mid int$$

Some strings in L(G)

I'M SUPPOSED TO WRITE A PAPER THAT PRESENT'S BOTH SIDES OF AN ISSUE AND THEN DEFENDS ONE OF THE ARGUMENTS.

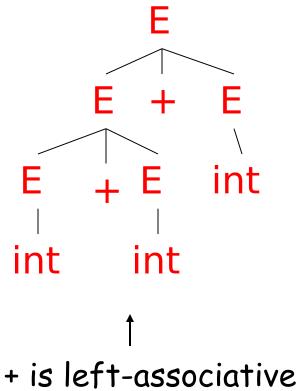

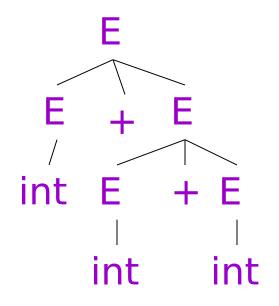

#### Ambiguity. Example

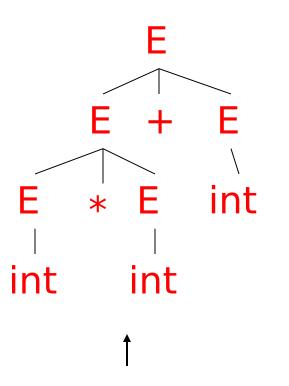

The string int + int + int has two parse trees

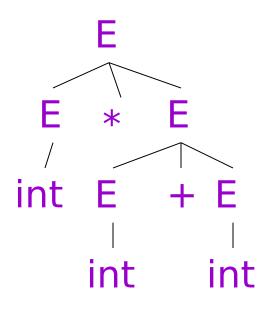

#### Ambiguity. Example

The string int \* int + int has two parse trees

<sup>\*</sup> has higher precedence than +

### Ambiguity (Cont.)

- A grammar is <u>ambiguous</u> if it has more than one parse tree for some string
  - Equivalently, there is more than one rightmost or left-most derivation for some string
- Ambiguity is <u>bad</u>
  - Leaves meaning of some programs ill-defined
- Ambiguity is <u>common</u> in programming languages
  - Arithmetic expressions
  - IF-THEN-ELSE

#### Dealing with Ambiguity

- There are several ways to handle ambiguity
- Most direct method is to rewrite the grammar unambiguously

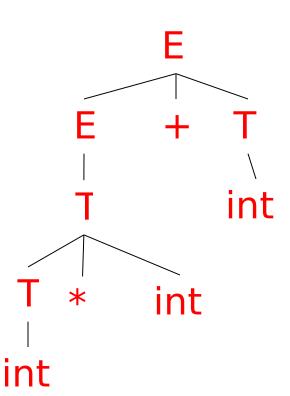

```
E \rightarrow E + T \mid T

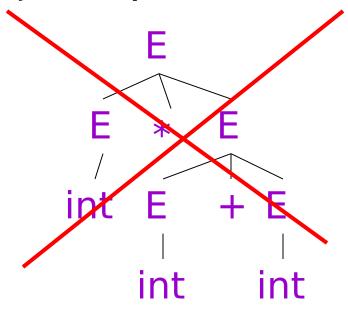

T \rightarrow T * int \mid int \mid (E)
```

- Enforces precedence of \* over +
- Enforces left-associativity of + and \*

#### Ambiguity. Example

The int \* int + int has ony one parse tree now

### Ambiguity: The Dangling Else

Consider this new grammar

```
E → if E then E

| if E then E else E

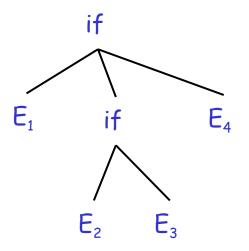

| OTHER
```

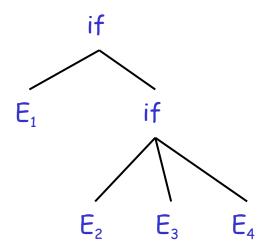

This grammar is also ambiguous

### The Dangling Else: Example

The string

has two parse trees

Typically we want the second form

#### The Dangling Else: A Fix

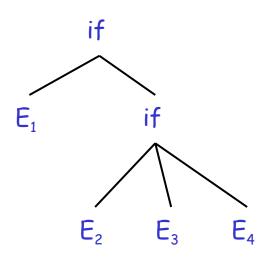

- else matches the closest unmatched then
- We can describe this in the grammar (distinguish between matched and unmatched "then")

Describes the same set of strings

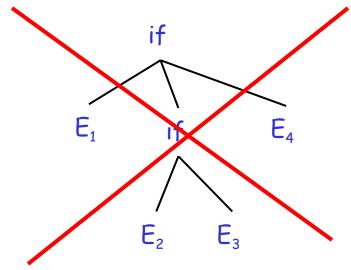

I if E then MIF else UIF

### The Dangling Else: Example Revisited

The expression if E<sub>1</sub> then if E<sub>2</sub> then E<sub>3</sub> else E<sub>4</sub>

 A valid parse tree (for a UIF)

 Not valid because the then expression is not a MIF

### **Ambiguity**

- No general techniques for handling ambiguity
- Impossible to convert automatically every ambiguous grammar to an unambiguous one
- Used with care, ambiguity can simplify the grammar
  - Sometimes allows more natural definitions
  - So we need disambiguation mechanisms
  - As shown next ...

### Precedence and Associativity Declarations

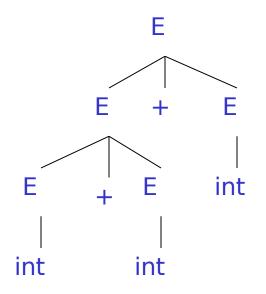

- Instead of rewriting the grammar
  - Use the more natural (ambiguous) grammar
  - Along with disambiguating declarations

 Most tools allow precedence and associativity declarations to disambiguate grammars

Examples ...

#### **Associativity Declarations**

- Consider the grammar  $E \rightarrow E + E \mid int$ 
  - And the string: int + int + int

Left-associativity declaration: %left + %left \*

#### Review

- We can specify language syntax using CFG
- A parser will answer whether s ∈ L(G)
- ... and will build a parse tree
- ... and pass on to the rest of the compiler

#### Next:

 How do we answer s ∈ L(G) and build a parse tree?

#### Homework

- WA1 (written homework) due
  - You must work alone.
  - Write or print out your answers.
  - Turn in before class Tuesday or in drop-box.
- Read Chapters 2.3 2.3.2
- PA2 (Lexer) Due
  - You may work in pairs.
