Publication: ASPLOS 2016

RAPID Programming of Pattern-Recognition Processors

ASPLOS 2016

April 2–6

Atlanta, GA

Acceptance Rate: 23%

Finding Needles in a Haystack

- Researchers and companies are collecting increasing amounts of data
- 44x data production in 2020 than in 2009[†]
- Demand for real-time analysis of collected data[‡]

[†] Computer Sciences Corporation. Big data universe beginning to explode. 2012

[‡] Capgemini. Big & fast data: The rise of insight- driven business. 2015.

Parallel Searches: Goals

- Fast processing
- Concise, maintainable representation
- Efficient compilation
 - High throughput
 - Low compilation time

Specialized Hardware

RAPID
Programming
Language

A researcher should spend his or her time designing an algorithm to find the important data, not building a machine that will obey said algorithm.

Micron's Automata Processor

- Accelerates identification of patterns in input data stream using massive parallelism
- Hardware implementation of non-deterministic finite automata
- 1 gbps data processing
- MISD architecture

Micron's Automata Processor

- Implements homogeneous NFAs
 - All incoming edges to state have same symbol(s)
 - State Transition Element (STE)
- Memory-derived architecture
 - Memory as a computational medium
 - State consists of a column in DRAM array
 - Connections made with reconfigurable routing matrix partitioned into blocks
- 1.5 million states on development board
- Saturating Up Counter, Boolean Logic

Current Programming Models

ANML

- Automata Network Markup Language
- Directly specify homogeneous NFA design
- High-level programming language bindings for generation

RegEx

- Support for a list of regular expressions
- Support for PCRE modifiers
- Compiled directly to binary

Programming Challenges

- ANML development akin to **assembly programming**
 - Requires knowledge of automata theory **and** hardware properties
 - Tedious and error-prone development process
- Regular expressions challenging to implement
 - Often exhaustive enumerations
 - Similarly error-prone

Programming Challenges

- Implement **single instance** of a problem
 - Each instance of a problem requires a brand new design
 - Need for meta-programs to generate final design
- Current programming models place unnecessary burden on developer

Goals: Current Approaches Fail

- Fast processing ✓
- Concise, maintainable representation ✗
- Efficient compilation
 - High throughput ✓
 - Low compilation time ⚠

RAPID at a Glance

- Provides concise, maintainable, and efficient representations for pattern-identification algorithms
- Conventional, C-style language with domain-specific parallel control structures
- Excels in applications where patterns are best represented as a combination of text and computation
- Compilation strategy balances synthesis time with device utilization

Program Structure

- **Macro**
 - Basic unit of computation
 - Sequential control flow
 - Boolean expressions as statements for terminating threads of computation
- **Network**
 - High-level pattern matching
 - Parallel control flow
 - Parameters to set run-time values

```
macro foo (...) { ... }
```

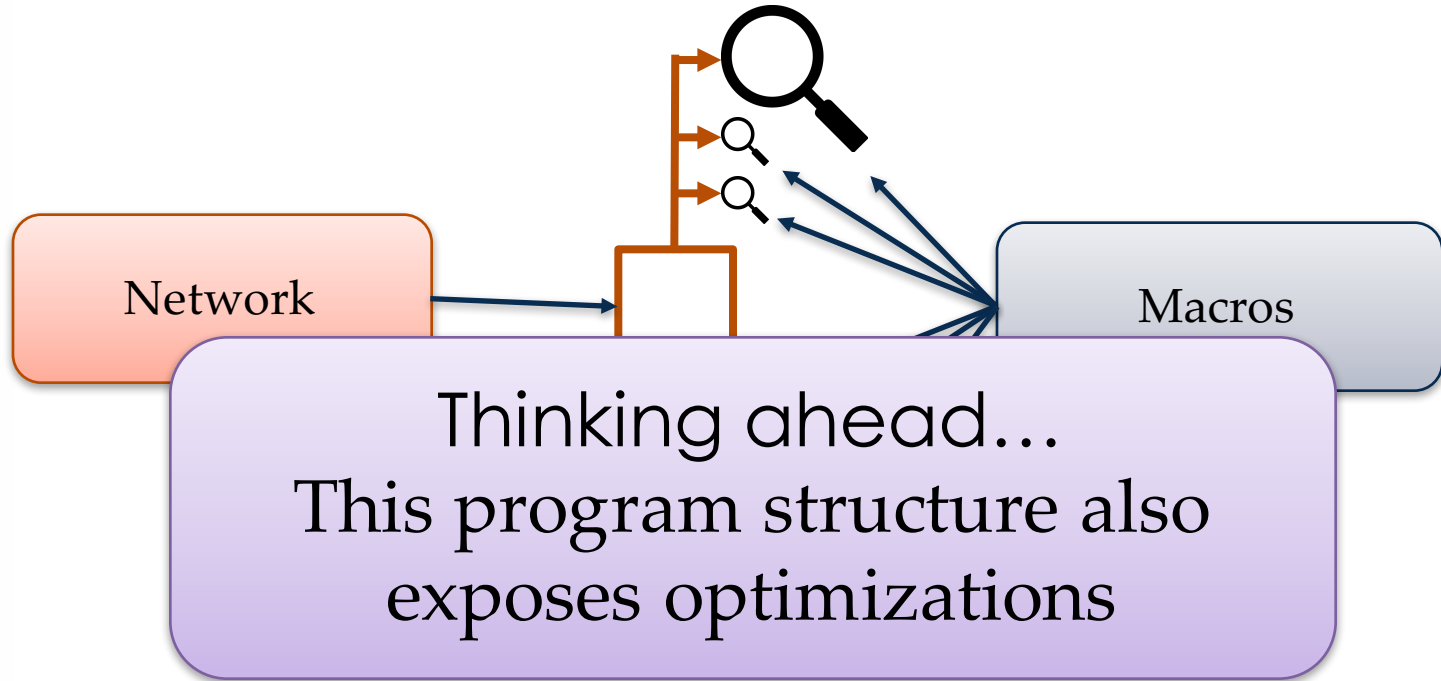

```
macro bar (...) { ... }
```

```
macro baz (...) { ... }
```

```
macro qux (...) {  
    ...  
}
```

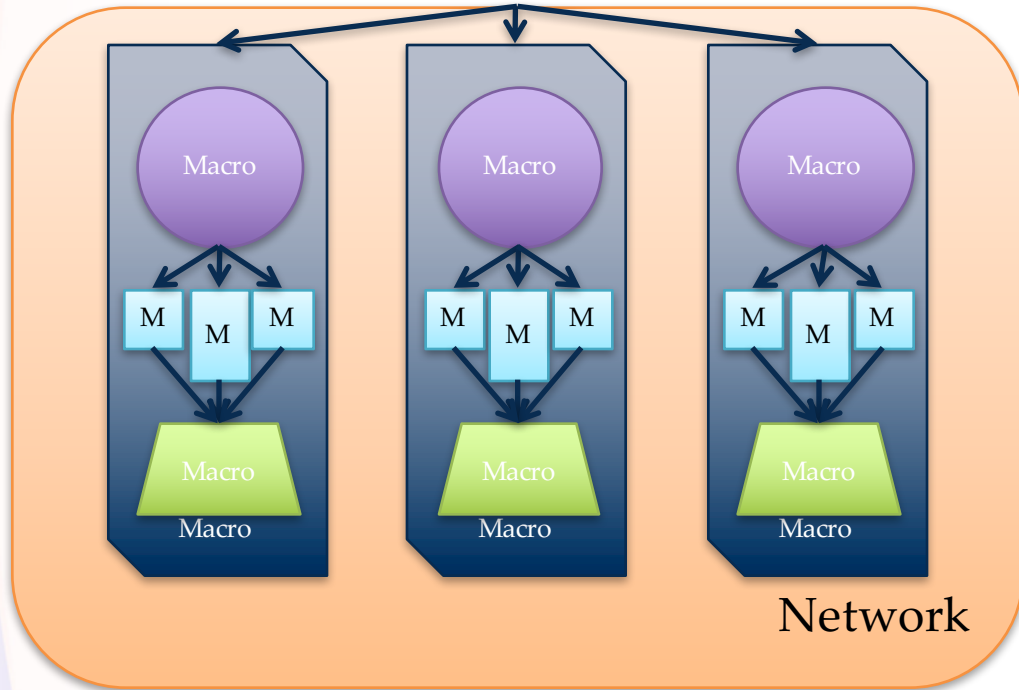

```
network (...) {  
    ...  
}
```

Program Structure

Thinking ahead...
This program structure also
exposes optimizations

Program Structure

```
macro foo (...) { ... }
```

```
macro bar (...) { ... }
```

```
macro baz (...) { ... }
```

```
macro qux (...) {  
    ...  
}
```

```
network ( ... ) {  
    ...  
}
```

Data in RAPID

- Input data stream as special function
 - Stream of characters
 - `input()`
 - Calls to `input()` are synchronized across all active macros
 - All active macros receive the same input character

Counting and Reporting

- Counter: Abstract representation of saturating up counters
 - Count and Reset operations
 - Can compare against threshold
- RAPID programs can *report*
 - Triggers creation of report event
 - Captures offset of input stream and current macro

Parallel Control Structures

- Concise specification of multiple, simultaneous comparisons against a single data stream
- Support MISD computational model
- Static and dynamic thread spawning for massive parallelism support
- Explicit support for sliding window computations

©NITBDELGMVUDBQZZDWIEFHPTG@ZBGEXDGHXSVCMKADSKFJÖKLGJADSKGOWESIOHGADHYCBGOASDGßAEGKQEYKPREBN...

Parallel Control Structures

Sequential Structure	Parallel Structure
if...else	either...orelse
foreach	some
while	whenever

Either/Or else Statements

```
either {  
    hamming_distance(s,d); //hamming distance  
    'y' == input();       //next input is 'y'  
    report;               //report candidate  
} or else {  
    while('y' != input()); //consume until 'y'  
}
```

- Perform parallel exploration of input data
- Static number of parallel operations

Some Statements

```
network (String[] comparisons) {  
    some (String s : comparisons)  
        hamming_distance (s, 5);  
}
```

- Parallel exploration may depend on candidate patterns
- Iterates over items, dynamically spawn computation

Whenever Statements

```
whenever( ALL_INPUT == input() ) {  
    foreach(char c : "rapid")  
        c == input();  
    report;  
}
```

- Body triggered whenever guard becomes true
- ALL_INPUT: any symbol in the input stream

Example RAPID Program

Association Rule Mining

Identify items from a database that frequently occur together

Example RAPID Program

If all symbols in item set match, increment counter

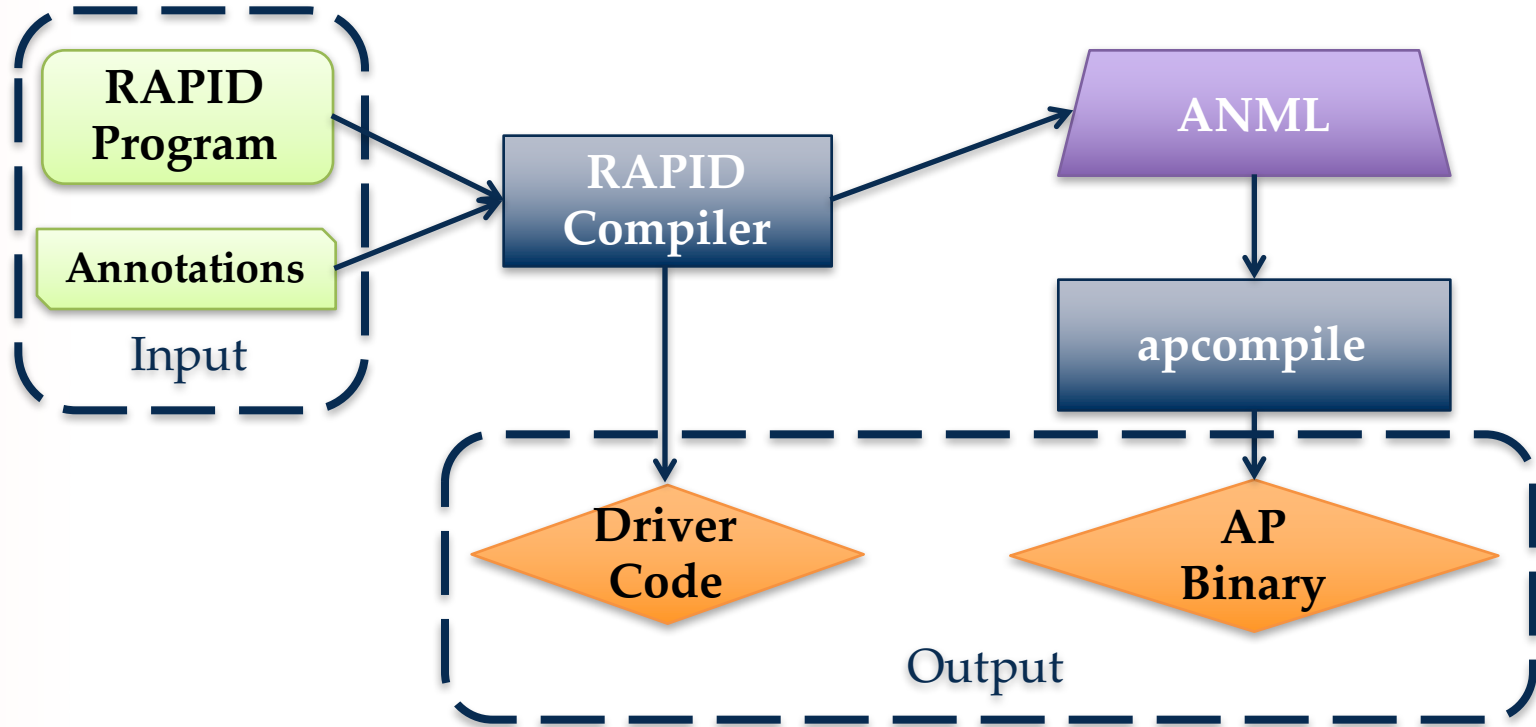

Spawn parallel computation for each item set

Sliding window search calls *frequent* on every input

Trigger *report* if threshold reached

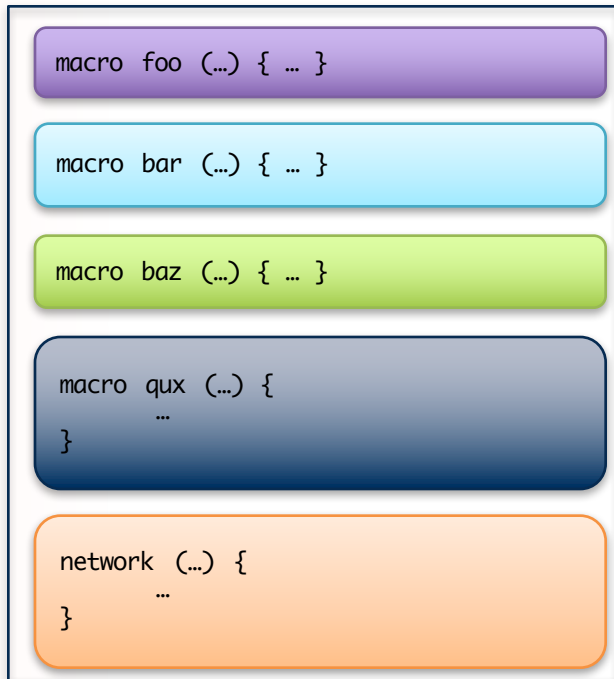

```
macro frequent (String set, Counter cnt) {  
  foreach(char c : set) {  
    while(input() != c);  
  }  
  cnt.count();  
}  
  
network (String[] set) {  
  some(String s : set) {  
    Counter cnt;  
    whenever(START_OF_INPUT == input())  
      frequent(s, cnt);  
    if (cnt > 128)  
      report;  
  }  
}
```

System Overview

Code Generation

RAPID Program

- Recursive transformation of RAPID program
 - Input Stream \rightarrow STEs
 - Counters \rightarrow 1 or more physical counter(s)
- Similar to RegEx \rightarrow NFA transformation

Challenge: Synthesis

- Placement and routing are resource-intensive
- Large AP designs often fail outright
- **Goal:** technique to reduce AP design such that synthesis tools succeed

Tessellation Optimization

- Automata Processor designs are often **repetitive**
- Programmatically **extract** repetition, and compile once
- Load **dynamically** at runtime

Reminder: Goals

- Fast processing ✓
- Concise, maintainable representation
- Efficient compilation
 - High throughput
 - Low compilation time

Research Questions

1. Do RAPID constructs generalize to pattern search problems across multiple problem domains?
2. (**Conciseness**) Do RAPID programs require fewer lines of code than a functionally equivalent ANML program to represent a given pattern search problem?
3. (**Maintainability**) Does a RAPID program require fewer modifications than an equivalent ANML program to alter functionality?
4. (**Efficiency**) Are RAPID programs no less efficient at runtime and during synthesis than hand-optimized ANML programs?

Research Questions

1. **Do RAPID constructs generalize to pattern search problems across multiple problem domains?**
2. (Conciseness) Do RAPID programs require fewer lines of code than a functionally equivalent ANML program to represent a given pattern search problem?
3. (Maintainability) Does a RAPID program require fewer modifications than an equivalent ANML program to alter functionality?
4. (Efficiency) Are RAPID programs no less efficient at runtime and during synthesis than hand-optimized ANML programs?

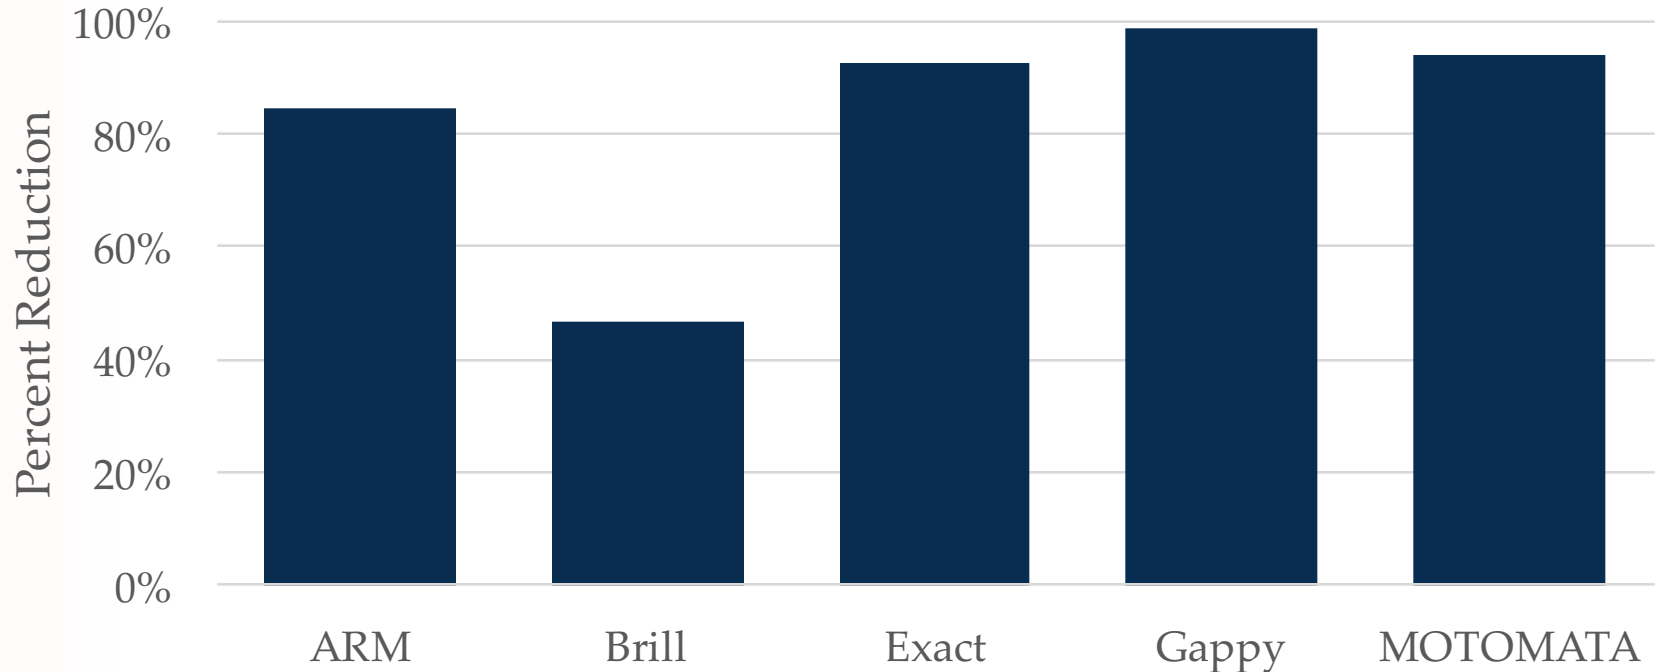

Description of Benchmarks

Benchmark	Description	Domain	Baseline Generation Method
<i>ARM</i>	Association Rule Mining	ML	Meta Program
<i>Brill</i>	Brill Part of Speech Tagging	NLP	Meta Program
<i>Exact</i>	Exact DNA Alignment	Bioinformatics	ANML
<i>Gappy</i>	DNA Alignment with Gaps	Bioinformatics	ANML
<i>MOTOMATA</i>	Planted Motif Search	Bioinformatics	ANML

Architectural Targets

RAPID
Program

Debugging Support

- Spurious reports in large data stream
- Can we quickly “sweep” to problematic region and inspect?
- Replay debugging

Conclusions

- RAPID is a **concise, maintainable, and efficient** high-level language for pattern-search algorithms
- Achieved with domain-specific **parallel control structures, and suitable data representations**
- Prototype compiler allows for acceleration using the Automata Processor
