

# Homework 6

## Git++

EECS 201 Winter 2020

### Submission Instructions

This homework will be submitted as a repository on the UMich GitLab server. The repository you submit will be a **private** project called `eeecs201-hw6`.

## 1 Cloning and changing a remote

To get started, create a **private** project under your UMich GitLab account called `eeecs201-hw6`. This is how the homework will be submitted.

To get started, clone this repository: `git@gitlab.umich.edu:eeecs201/content/hw/eeecs201-hw6.git`. We're going to make a local version of every remote branch.

```
# clone the repository
git clone git@gitlab.umich.edu:eeecs201/content/hw/eeecs201-hw6.git
cd eeecs201-hw6

# make a local branch for each remote branch
# this command is a one-liner; just ran out of space on the page
for branch in $(git branch -a | grep "remotes/origin" | grep -v "HEAD" | sed -e "s:remotes/origin/:");
do git checkout "$branch"; done

# there are other ways to do something similar to this, like forking the repo or cloning it as a mirror
```

By default when you clone a remote called `origin` will be created and its URL will be set to where you cloned it from. We'll need to change the URL of `origin` to point to your project, and then push all the branches to it.

```
# set the url for a remote
git remote set-url origin git@gitlab.umich.edu:<username>/eeecs201-hw6.git

# push all branches to the remote
git push -u origin --all
```

There are two feature branches: `bug-space-stdout` and `feat-spongebob`. We'll be looking at both of them in the assignment. In this assignment, the main branch is `dev`.

If you mess up at any point with your local branches, you can always `git reset --hard` to a remote branch, like `origin/dev` and `origin/feat-spongebob`.

## 2 Merge conflict

In this question we'll be merging in a branch that will cause a merge conflict: the `bug-space-stdout` feature branch into `dev`. In this situation, `bug-space-stdout` branched off from `dev` and then `dev` had another commit pushed to it, so a divergence point has formed. What `bug-space-stdout`'s new commit does is fix `space.cpp` so that it outputs to standard output instead of standard error. What `dev`'s new commit does is replace the use of C `stdio` calls (e.g. `printf`) with C++ `iostream` calls (e.g. `cout <<`).

1. Switch to the `dev` local branch.
2. Run `$ make` to build the application that the repo is versioning. If you want to, play around with it.
3. Run `$ git merge bug-space-stdout` to merge `bug-space-stdout` into the current branch (`dev`).
4. This will cause a merge conflict. The merging process will stop for you to deal with the files that have encountered merge conflicts. These files will have parts of them marked off that indicate what the conflicting commits are saying the file should have.

5. Deal with the files in conflict. If you have trouble understanding what needs to be fixed, investigate the latest commit in `dev` and `bug-space-stdout` to see what their goals are. You can do this by using `git log`, `git show`, and `git diff`. In the end, your fix for the merge conflict should reconcile the ideas in both commits: as a result of this merge, `space.cpp` should use C++ `iostreams` to output to standard out (barring the error printout when not enough arguments are provided).
6. When you are done handling the conflict, stage the appropriate files and commit. A merge commit message will automatically be worded for you.
7. Hooray! You have successfully dealt with a merge conflict!

Some tips:

- The C++ `iostream` equivalent of `stdout` is `cout`
- The C++ `iostream` equivalent of `stderr` is `cerr`

### 3 Cleaning up with `git rebase`

In this question we'll be using `git rebase` on `feat-spongebob` to clean up its history and get it ready for merging.

1. Switch to the `feat-spongebob` local branch.
2. Run `$ git log`. Note how that there are a bunch of commits that begin with "squashme". Each of these commits contain really tiny changes that don't really warrant commits by themselves for the addition of a new feature.
3. Recall that "squashing" commits puts the contents of multiple commits into one big commit.
4. Use `$ git rebase -i` to interactively rebase and squash the commits that begin with "squashme" into the "Add spongebob mocking text command" commit. The new commit message should discard of all of the "squashme" messages.  
(In reality, commits that should be squashed might not be nicely labeled "squashme". I personally do it when I know that I'm making a super tiny change that I'll squash in the end, and for this homework it's to more easily communicate to you all what I want to be squashed.)
5. Switch back to the `dev` branch.
6. Run `$ git merge feat-spongebob` to bring that feature back into the `dev` branch.

### 4 Conclusion

1. Make sure that you are on the `dev` branch.
2. To see that the resulting code compiles, run `$ make`.
3. Try running `$ ./memetext space 'Hello world!'` and `$ ./memetext spongebob 'Hello world!'`
4. Create a file called `REPORT`.
5. Like with HW3 and HW5, on the first line provide an integer time in minutes of how long it took for you to complete this assignment.
6. On the second line and beyond, write down what you learned while doing this assignment. If you already knew how to do all of this, put down "N/A".
7. Add and commit the report file.
8. Run `$ git push` to push the new commits on the local `dev` branch to your campus GitLab project.
