

EECS 489 PA1

Zhiyun Qian

Code base

- How many of you still cannot get the program running?
 - Download the new code
- Functions already implemented in .o
 - But you need to implement them again
 - Check with it as the specification
- Incrementally implement your code and replace old .o with yours.

Task 1

- `vip_input()`
 - Get VIP header, integrity check, receive or forward
- `vip_output()`
 - Find next hop to send packet, error?
- `vip_forw()`
 - Route the packets to the next vrouter
- `vip_drop()`
 - Discard packets and generate error code when appropriate

Task 1 - Common questions

- Byte order
 - ntohs() vs. htons()
- When to convert from char* to int and vice versa
- Hop count
- vif_pullup() vs. vif_pullupn()
- How to clear interface?
- packets_buf full error

Byte order

- `ntohs()` vs. `htons()`
 - `ntohs()`: Network byte order to host
 - `htons()`: Host to network
- Example:
 - `0x12345678` vs. `0x78563412`

When to convert from char* to int and vice versa

```
char* a = "123";  
int b = atoi(a);
```

- No need to do it when you pull up the header.
 1. `char* buf = malloc(sizeof(vip_t));`
`vif_pullupn(vif, buf, sizeof(vip_t));`
`vip_t* vip = (vip_t*) buf;`
 2. `vif_pullupn(vif, (char *) &vip, sizeof(vip_t));`
- You can check on you own by trying to print out the content

```
struct _vip_hdr {  
    u_short vip_ver;    /* version number */  
    u_short vip_hop;    /* hop limit */  
    u_short vip_len;    /* packet size, excluding header */  
    u_short vip_prot;   /* protocol number */  
    vin_addr_t vip_src; /* source vin address, see vnet.h */  
    vin_addr_t vip_dst; /* destination vin address */  
};  
typedef struct _vip_hdr vip_t;
```

Hop count

- Decrement the hop count field in VIP header by 1 whenever the packet go through a vrouter
- In vip_forw()
- Not related to link cost at this point

vif_pullup() vs. vif_pullupn()

- Better guarantee by vif_pullupn()
- Should use vif_pullupn() in most cases
 - Except for clearing interface

packets_buf full error

- Reliable VTP Packets unACKed.

How to clear interface?

- Look at the comments at the end of vip_input()
- Use vip_pullup()

Task 2 - VCMMP error messages

- When to generate VCMMP messages
 - Hop count exceeded
 - Host unreachable (no route to the host)
 - Link down (route found but error in transmission)
 - Unknown protocol (in VIP header)
- For all other errors, you are not required, but encouraged to think about when it is necessary to generate error message
- Never generate error message for VCMMP packet

Task 2 - VCMP error messages

- Don't forget to wrap the original VIP header in the error message

Task 3 – end-to-end retransmission

- Simulate TCP's basic functionality
- TCP has:
 - Retransmission
 - In-order delivery
 - congestion control
- We only need to implement retransmission
- End-to-end vs. Hop-by-hop retransmission

Task 3 - end-to-end retransmission

- Concepts
 - Reliable VTP packet vs. Unreliable VTP packet
 - ACK packet
 - Retransmission window
 - Timeout
- Retransmit ACK?
- Piggyback ACK

Q&A

- Thanks!
